You may create a printed copy of this documentation solely for your own personal use. Conversion to other formats is allowed as long as the actual content is not altered or edited in any way. You shall not publish or distribute this documentation in any form or on any media, except if you distribute the documentation in a manner similar to how Oracle disseminates it (that is, electronically for download on a Web site with the software) or on a CD-ROM or similar medium, provided however that the documentation is disseminated together with the software on the same medium. Any other use, such as any dissemination of printed copies or use of this documentation, in whole or in part, in another publication, requires the prior written consent from an authorized representative of Oracle. Oracle and/ or its affiliates reserve any and all rights to this documentation not expressly granted above.

Chapter 1 INFORMATION_SCHEMA Tables

INFORMATION_SCHEMA provides access to database *metadata*, information about the MySQL server such as the name of a database or table, the data type of a column, or access privileges. Other terms that are sometimes used for this information are *data dictionary* and *system catalog*.

Usage Notes for the INFORMATION_SCHEMA Database

INFORMATION_SCHEMA is a database within each MySQL instance, the place that stores information about all the other databases that the MySQL server maintains. The INFORMATION_SCHEMA database contains several read-only tables. They are actually views, not base tables, so there are no files associated with them, and you cannot set triggers on them. Also, there is no database directory with that name.

Although you can select INFORMATION_SCHEMA as the default database with a USE statement, you can only read the contents of tables, not perform INSERT, UPDATE, or DELETE operations on them.

Example

Here is an example of a statement that retrieves information from INFORMATION_SCHEMA:

```
mysql> SELECT table_name, table_type, engine
   -> FROM information_schema.tables
   -> WHERE table_schema = 'db5'
   -> ORDER BY table_name;
| table_name | table_type | engine |
          | BASE TABLE | InnoDB
 fk2
           | BASE TABLE | InnoDB
           | BASE TABLE | MyISAM
 goto
           BASE TABLE | MyISAM
           | BASE TABLE | MyISAM
 kurs
          BASE TABLE | MyISAM
 loop
           | BASE TABLE | MyISAM
 pk
           | BASE TABLE | InnoDB
           BASE TABLE | MyISAM
           BASE TABLE | MYISAM
 t.2
 t3
t7
          | BASE TABLE | MyISAM
 tables | BASE TABLE | MyISAM
             VIEW
                          NULL
 v2
             VIEW
                        NULL
 v3
             VIEW
                        NULL
 v56
                        NULL
            VIEW
17 rows in set (0.01 sec)
```

Explanation: The statement requests a list of all the tables in database db5, showing just three pieces of information: the name of the table, its type, and its storage engine.

Character Set Considerations

The definition for character columns (for example, TABLES.TABLE_NAME) is generally VARCHAR(N) CHARACTER SET utf8 where N is at least 64. MySQL uses the default collation for this character set (utf8_general_ci) for all searches, sorts, comparisons, and other string operations on such columns.

Because some MySQL objects are represented as files, searches in INFORMATION_SCHEMA string columns can be affected by file system case sensitivity. For more information, see Collation and INFORMATION_SCHEMA Searches.

INFORMATION_SCHEMA as Alternative to SHOW Statements

The SELECT ... FROM INFORMATION_SCHEMA statement is intended as a more consistent way to provide access to the information provided by the various SHOW statements that MySQL supports (SHOW DATABASES, SHOW TABLES, and so forth). Using SELECT has these advantages, compared to SHOW:

- It conforms to Codd's rules, because all access is done on tables.
- You can use the familiar syntax of the SELECT statement, and only need to learn some table and column names.
- The implementor need not worry about adding keywords.
- You can filter, sort, concatenate, and transform the results from INFORMATION_SCHEMA queries into whatever format your application needs, such as a data structure or a text representation to parse.
- This technique is more interoperable with other database systems. For example, Oracle Database users are familiar with querying tables in the Oracle data dictionary.

Because SHOW is familiar and widely used, the SHOW statements remain as an alternative. In fact, along with the implementation of INFORMATION_SCHEMA, there are enhancements to SHOW as described in Chapter 27, Extensions to SHOW Statements.

Privileges

Each MySQL user has the right to access these tables, but can see only the rows in the tables that correspond to objects for which the user has the proper access privileges. In some cases (for example, the ROUTINE_DEFINITION column in the INFORMATION_SCHEMA.ROUTINES table), users who have insufficient privileges see NULL. These restrictions do not apply for InnoDB tables; you can see them with only the PROCESS privilege.

The same privileges apply to selecting information from INFORMATION_SCHEMA and viewing the same information through SHOW statements. In either case, you must have some privilege on an object to see information about it.

Performance Considerations

INFORMATION_SCHEMA queries that search for information from more than one database might take a long time and impact performance. To check the efficiency of a query, you can use EXPLAIN. For information about using EXPLAIN output to tune INFORMATION_SCHEMA queries, see Optimizing INFORMATION_SCHEMA Queries.

Standards Considerations

The implementation for the INFORMATION_SCHEMA table structures in MySQL follows the ANSI/ISO SQL:2003 standard Part 11 *Schemata*. Our intent is approximate compliance with SQL:2003 core feature F021 *Basic information schema*.

Users of SQL Server 2000 (which also follows the standard) may notice a strong similarity. However, MySQL has omitted many columns that are not relevant for our implementation, and added columns that are MySQL-specific. One such column is the ENGINE column in the INFORMATION_SCHEMA.TABLES table.

Although other DBMSs use a variety of names, like syscat or system, the standard name is INFORMATION_SCHEMA.

To avoid using any name that is reserved in the standard or in DB2, SQL Server, or Oracle, we changed the names of some columns marked "MySQL extension". (For example, we changed

COLLATION to TABLE_COLLATION in the TABLES table.) See the list of reserved words near the end of this article: https://web.archive.org/web/20070428032454/http://www.dbazine.com/db2/db2-disarticles/gulutzan5.

Conventions in the INFORMATION_SCHEMA Reference Sections

The following sections describe each of the tables and columns in INFORMATION_SCHEMA. For each column, there are three pieces of information:

- "INFORMATION_SCHEMA Name" indicates the name for the column in the INFORMATION_SCHEMA table. This corresponds to the standard SQL name unless the "Remarks" field says "MySQL extension."
- "SHOW Name" indicates the equivalent field name in the closest SHOW statement, if there is one.
- "Remarks" provides additional information where applicable. If this field is NULL, it means that the
 value of the column is always NULL. If this field says "MySQL extension," the column is a MySQL
 extension to standard SQL.

Many sections indicate what SHOW statement is equivalent to a SELECT that retrieves information from INFORMATION_SCHEMA. For SHOW statements that display information for the default database if you omit a FROM <code>db_name</code> clause, you can often select information for the default database by adding an AND <code>TABLE_SCHEMA</code> = <code>SCHEMA()</code> condition to the <code>WHERE</code> clause of a query that retrieves information from an <code>INFORMATION_SCHEMA</code> table.

For information about INFORMATION_SCHEMA tables specific to the InnoDB storage engine, see INFORMATION_SCHEMA Tables for InnoDB.

For answers to questions that are often asked concerning the INFORMATION_SCHEMA database, see Chapter 28, MySQL 5.7 FAQ: INFORMATION_SCHEMA.

Chapter 2 The INFORMATION_SCHEMA SCHEMATA Table

A schema is a database, so the SCHEMATA table provides information about databases.

INFORMATION_SCHEMA Name	sноw Name	Remarks
CATALOG_NAME		def
SCHEMA_NAME	Database	
DEFAULT_CHARACTER_SET_NAME		
DEFAULT_COLLATION_NAME		
SQL_PATH		NULL

The following statements are equivalent:

```
SELECT SCHEMA_NAME AS `Database`

FROM INFORMATION_SCHEMA.SCHEMATA
[WHERE SCHEMA_NAME LIKE 'wild']
SHOW DATABASES
[LIKE 'wild']
```

Chapter 3 The INFORMATION_SCHEMA TABLES Table

The TABLES table provides information about tables in databases.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		def
TABLE_SCHEMA	Table	
TABLE_NAME	Table	
TABLE_TYPE		
ENGINE	Engine	MySQL extension
VERSION	Version	The version number of the table's .frm file, MySQL extension
ROW_FORMAT	Row_format	MySQL extension
TABLE_ROWS	Rows	MySQL extension
AVG_ROW_LENGTH	Avg_row_length	MySQL extension
DATA_LENGTH	Data_length	MySQL extension
MAX_DATA_LENGTH	Max_data_length	MySQL extension
INDEX_LENGTH	Index_length	MySQL extension
DATA_FREE	Data_free	MySQL extension
AUTO_INCREMENT	Auto_increment	MySQL extension
CREATE_TIME	Create_time	MySQL extension
UPDATE_TIME	Update_time	MySQL extension
CHECK_TIME	Check_time	MySQL extension
TABLE_COLLATION	Collation	MySQL extension
CHECKSUM	Checksum	MySQL extension
CREATE_OPTIONS	Create_options	MySQL extension
TABLE_COMMENT	Comment	MySQL extension

Notes:

- Refer to SHOW TABLE STATUS for field descriptions.
- TABLE_SCHEMA and TABLE_NAME are a single field in a SHOW display, for example Table_in_db1.
- TABLE_TYPE should be BASE TABLE or VIEW. The TABLES table does not list TEMPORARY tables.
- For partitioned tables, the ENGINE column shows the name of the storage engine used by all partitions. (Previously, this column showed PARTITION for such tables.)
- The TABLE_ROWS column is NULL if the table is in the INFORMATION_SCHEMA database.

For InnoDB tables, the row count is only a rough estimate used in SQL optimization. (This is also true if the InnoDB table is partitioned.)

- The DATA_FREE column shows the free space in bytes for InnoDB tables.
- Prior to MySQL 5.7.8, for partitioned InnoDB tables, the CREATE_TIME column always showed NULL. This column shows the correct table creation time for such tables in MySQL 5.7.8 and later. (Bug #17299181, Bug #69990)

• Beginning with MySQL 5.7.2, UPDATE_TIME displays a timestamp value for the last UPDATE, INSERT, or DELETE performed on InnoDB tables that are not partitioned. Previously, UPDATE_TIME displayed a NULL value for InnoDB tables. For MVCC, the timestamp value reflects the COMMIT time, which is considered the last update time. Timestamps are not persisted when the server is restarted or when the table is evicted from the InnoDB data dictionary cache.

The UPDATE_TIME column also shows this information for partitioned InnoDB tables in MySQL 5.7.8 and later. Previously this column was always NULL for such tables. (Bug #17299181, Bug #69990)

- For partitioned Innode tables, the CHECK TIME column is always NULL.
- We have nothing for the table's default character set. TABLE_COLLATION is close, because collation names begin with a character set name.
- The CREATE_OPTIONS column shows partitioned if the table is partitioned.

The following statements are equivalent:

```
SELECT table_name FROM INFORMATION_SCHEMA.TABLES

WHERE table_schema = 'db_name'

[AND table_name LIKE 'wild']

SHOW TABLES

FROM db_name

[LIKE 'wild']
```

Chapter 4 The INFORMATION_SCHEMA COLUMNS Table

The COLUMNS table provides information about columns in tables.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		def
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME	Field	
ORDINAL_POSITION		see notes
COLUMN_DEFAULT	Default	
IS_NULLABLE	Null	
DATA_TYPE	Туре	
CHARACTER_MAXIMUM_LENGTH	Туре	
CHARACTER_OCTET_LENGTH		
NUMERIC_PRECISION	Туре	
NUMERIC_SCALE	Туре	
DATETIME_PRECISION	Туре	
CHARACTER_SET_NAME		
COLLATION_NAME	Collation	
COLUMN_TYPE	Туре	MySQL extension
COLUMN_KEY	Key	MySQL extension
EXTRA	Extra	MySQL extension
PRIVILEGES	Privileges	MySQL extension
COLUMN_COMMENT	Comment	MySQL extension
GENERATION_EXPRESSION		MySQL extension

Notes:

- In Show, the Type display includes values from several different COLUMNS columns.
- ORDINAL_POSITION is necessary because you might want to say ORDER BY ORDINAL_POSITION. Unlike SHOW, SELECT does not have automatic ordering.
- CHARACTER_OCTET_LENGTH should be the same as CHARACTER_MAXIMUM_LENGTH, except for multibyte character sets.
- CHARACTER_SET_NAME can be derived from Collation. For example, if you say SHOW FULL COLUMNS FROM t, and you see in the Collation column a value of latin1_swedish_ci, the character set is what is before the first underscore: latin1.
- GENERATION_EXPRESSION is nonempty for generated columns and displays the expression used to compute column values. For information about generated columns, see CREATE TABLE and Generated Columns. This column was added in MySQL 5.7.6.
- As of MySQL 5.7.6, the EXTRA column contains VIRTUAL GENERATED or VIRTUAL STORED for generated columns.

The following statements are nearly equivalent:

```
SELECT COLUMN_NAME, DATA_TYPE, IS_NULLABLE, COLUMN_DEFAULT

FROM INFORMATION_SCHEMA.COLUMNS

WHERE table_name = 'tbl_name'

[AND table_schema = 'db_name']

[AND column_name LIKE 'wild']

SHOW COLUMNS

FROM tbl_name

[FROM db_name]

[LIKE 'wild']
```

Chapter 5 The INFORMATION_SCHEMA STATISTICS Table

The STATISTICS table provides information about table indexes.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		def
TABLE_SCHEMA		= Database
TABLE_NAME	Table	
NON_UNIQUE	Non_unique	
INDEX_SCHEMA		= Database
INDEX_NAME	Key_name	
SEQ_IN_INDEX	Seq_in_index	
COLUMN_NAME	Column_name	
COLLATION	Collation	
CARDINALITY	Cardinality	
SUB_PART	Sub_part	MySQL extension
PACKED	Packed	MySQL extension
NULLABLE	Null	MySQL extension
INDEX_TYPE	Index_type	MySQL extension
COMMENT	Comment	MySQL extension
INDEX_COMMENT	Index_comment	MySQL extension

Notes:

• There is no standard table for indexes. The preceding list is similar to what SQL Server 2000 returns for sp_statistics, except that we replaced the name QUALIFIER with CATALOG and we replaced the name OWNER with SCHEMA.

Clearly, the preceding table and the output from SHOW INDEX are derived from the same parent. So the correlation is already close.

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.STATISTICS

WHERE table_name = 'tbl_name'

AND table_schema = 'db_name'

SHOW INDEX

FROM tbl_name

FROM db_name
```

12

Chapter 6 The INFORMATION_SCHEMA USER_PRIVILEGES Table

The ${\tt USER_PRIVILEGES}$ table provides information about global privileges. This information comes from the ${\tt mysql.user}$ grant table.

INFORMATION_SCHEMA Name	sноw Name	Remarks
GRANTEE		'user_name'@'host_name value, MySQL extension
TABLE_CATALOG		def, MySQL extension
PRIVILEGE_TYPE		MySQL extension
IS_GRANTABLE		MySQL extension

Notes:

• This is a nonstandard table. It takes its values from the mysql.user table.

14		

Chapter 7 The INFORMATION_SCHEMA SCHEMA_PRIVILEGES Table

The $SCHEMA_PRIVILEGES$ table provides information about schema (database) privileges. This information comes from the mysql.db grant table.

INFORMATION_SCHEMA Name	sноw Name	Remarks
GRANTEE		'user_name'@'host_name value, MySQL extension
TABLE_CATALOG		def, MySQL extension
TABLE_SCHEMA		MySQL extension
PRIVILEGE_TYPE		MySQL extension
IS_GRANTABLE		MySQL extension

Notes:

• This is a nonstandard table. It takes its values from the mysql.db table.

16	

Chapter 8 The INFORMATION_SCHEMA TABLE_PRIVILEGES Table

The TABLE_PRIVILEGES table provides information about table privileges. This information comes from the mysql.tables_priv grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name value
TABLE_CATALOG		def
TABLE_SCHEMA		
TABLE_NAME		
PRIVILEGE_TYPE		
IS_GRANTABLE		

Notes:

• PRIVILEGE_TYPE can contain one (and only one) of these values: SELECT, INSERT, UPDATE, REFERENCES, ALTER, INDEX, DROP, CREATE VIEW.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.TABLE_PRIVILEGES
SHOW GRANTS ...
```

18

Chapter 9 The INFORMATION_SCHEMA COLUMN_PRIVILEGES Table

The COLUMN_PRIVILEGES table provides information about column privileges. This information comes from the mysql.columns_priv grant table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
GRANTEE		'user_name'@'host_name value
TABLE_CATALOG		def
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME		
PRIVILEGE_TYPE		
IS_GRANTABLE		

Notes:

- In the output from SHOW FULL COLUMNS, the privileges are all in one field and in lowercase, for example, select, insert, update, references. In COLUMN_PRIVILEGES, there is one privilege per row, in uppercase.
- PRIVILEGE_TYPE can contain one (and only one) of these values: SELECT, INSERT, UPDATE, REFERENCES.
- If the user has GRANT OPTION privilege, IS_GRANTABLE should be YES. Otherwise, IS_GRANTABLE should be NO. The output does not list GRANT OPTION as a separate privilege.

The following statements are *not* equivalent:

```
SELECT ... FROM INFORMATION_SCHEMA.COLUMN_PRIVILEGES
SHOW GRANTS ...
```

2	\cap
_	U

Chapter 10 The INFORMATION_SCHEMA CHARACTER_SETS Table

The CHARACTER_SETS table provides information about available character sets.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
CHARACTER_SET_NAME	Charset	
DEFAULT_COLLATE_NAME	Default collation	
DESCRIPTION	Description	MySQL extension
MAXLEN	Maxlen	MySQL extension

The following statements are equivalent:

```
SELECT * FROM INFORMATION_SCHEMA.CHARACTER_SETS
[WHERE CHARACTER_SET_NAME LIKE 'wild']
SHOW CHARACTER SET
[LIKE 'wild']
```

22		

Chapter 11 The INFORMATION_SCHEMA COLLATIONS Table

The COLLATIONS table provides information about collations for each character set.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
COLLATION_NAME	Collation	
CHARACTER_SET_NAME	Charset	MySQL extension
ID	Id	MySQL extension
IS_DEFAULT	Default	MySQL extension
IS_COMPILED	Compiled	MySQL extension
SORTLEN	Sortlen	MySQL extension

- COLLATION_NAME is the collation name.
- CHARACTER_SET_NAME is the name of the character set with which the collation is associated.
- ID is the collation ID.
- IS_DEFAULT indicates whether the collation is the default for its character set.
- IS_COMPILED indicates whether the character set is compiled into the server.
- SORTLEN is related to the amount of memory required to sort strings expressed in the character set.

Collation information is also available from the SHOW COLLATION statement. The following statements are equivalent:

```
SELECT COLLATION_NAME FROM INFORMATION_SCHEMA.COLLATIONS

[WHERE COLLATION_NAME LIKE 'wild']

SHOW COLLATION

[LIKE 'wild']
```

2	1
_	4

Chapter 12 The INFORMATION_SCHEMA COLLATION_CHARACTER_SET_APPLICABILITY Table

The COLLATION_CHARACTER_SET_APPLICABILITY table indicates what character set is applicable for what collation. The columns are equivalent to the first two display fields that we get from SHOW COLLATION.

INFORMATION_SCHEMA Name	sноw Name	Remarks
COLLATION_NAME	Collation	
CHARACTER_SET_NAME	Charset	

2	2
_	O

Chapter 13 The INFORMATION_SCHEMA TABLE_CONSTRAINTS Table

The TABLE_CONSTRAINTS table describes which tables have constraints.

INFORMATION_SCHEMA Name	sноw Name	Remarks
CONSTRAINT_CATALOG		def
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
TABLE_SCHEMA		
TABLE_NAME		
CONSTRAINT_TYPE		

Notes:

- The CONSTRAINT_TYPE value can be UNIQUE, PRIMARY KEY, or FOREIGN KEY.
- The UNIQUE and PRIMARY KEY information is about the same as what you get from the Key_name field in the output from SHOW INDEX when the Non_unique field is 0.
- The CONSTRAINT_TYPE column can contain one of these values: UNIQUE, PRIMARY KEY, FOREIGN KEY, CHECK. This is a CHAR (not ENUM) column. The CHECK value is not available until we support CHECK.

28			

Chapter 14 The INFORMATION_SCHEMA KEY_COLUMN_USAGE Table

The KEY_COLUMN_USAGE table describes which key columns have constraints.

INFORMATION_SCHEMA Name	sноw Name	Remarks
CONSTRAINT_CATALOG		def
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
TABLE_CATALOG		def
TABLE_SCHEMA		
TABLE_NAME		
COLUMN_NAME		
ORDINAL_POSITION		
POSITION_IN_UNIQUE_CONSTRAINT		
REFERENCED_TABLE_SCHEMA		
REFERENCED_TABLE_NAME		
REFERENCED_COLUMN_NAME		

Notes:

- If the constraint is a foreign key, then this is the column of the foreign key, not the column that the foreign key references.
- The value of ORDINAL_POSITION is the column's position within the constraint, not the column's position within the table. Column positions are numbered beginning with 1.
- The value of POSITION_IN_UNIQUE_CONSTRAINT is NULL for unique and primary-key constraints. For foreign-key constraints, it is the ordinal position in key of the table that is being referenced.

Suppose that there are two tables name t1 and t3 that have the following definitions:

```
CREATE TABLE t1
(
    s1 INT,
    s2 INT,
    s3 INT,
    PRIMARY KEY(s3)
) ENGINE=InnoDB;
CREATE TABLE t3
(
    s1 INT,
    s2 INT,
    s3 INT,
    KEY(s1),
    CONSTRAINT CO FOREIGN KEY (s2) REFERENCES t1(s3)
) ENGINE=InnoDB;
```

For those two tables, the KEY_COLUMN_USAGE table has two rows:

- One row with CONSTRAINT_NAME = 'PRIMARY', TABLE_NAME = 't1', COLUMN_NAME = 's3', ORDINAL_POSITION = 1, POSITION_IN_UNIQUE_CONSTRAINT = NULL.
- One row with CONSTRAINT_NAME = 'CO', TABLE_NAME = 't3', COLUMN_NAME = 's2', ORDINAL POSITION = 1, POSITION IN UNIQUE CONSTRAINT = 1.

2	\cap
J	U

Chapter 15 The INFORMATION_SCHEMA ROUTINES Table

The ROUTINES table provides information about stored routines (both procedures and functions). The ROUTINES table does not include user-defined functions (UDFs).

The column named "mysql.proc name" indicates the mysql.proc table column that corresponds to the INFORMATION_SCHEMA.ROUTINES table column, if any.

INFORMATION_SCHEMA Name	mysql.proc Name	Remarks
SPECIFIC_NAME	specific_name	
ROUTINE_CATALOG		def
ROUTINE_SCHEMA	db	
ROUTINE_NAME	name	
ROUTINE_TYPE	type	{PROCEDURE FUNCTION}
DATA_TYPE		same as for COLUMNS table
CHARACTER_MAXIMUM_LENGTH		same as for COLUMNS table
CHARACTER_OCTET_LENGTH		same as for COLUMNS table
NUMERIC_PRECISION		same as for COLUMNS table
NUMERIC_SCALE		same as for COLUMNS table
DATETIME_PRECISION		same as for COLUMNS table
CHARACTER_SET_NAME		same as for COLUMNS table
COLLATION_NAME		same as for COLUMNS table
DTD_IDENTIFIER		data type descriptor
ROUTINE_BODY		SQL
ROUTINE_DEFINITION	body_utf8	
EXTERNAL_NAME		NULL
EXTERNAL_LANGUAGE	language	NULL
PARAMETER_STYLE		SQL
IS_DETERMINISTIC	is_deterministic	
SQL_DATA_ACCESS	sql_data_access	
SQL_PATH		NULL
SECURITY_TYPE	security_type	
CREATED	created	
LAST_ALTERED	modified	
SQL_MODE	sql_mode	MySQL extension
ROUTINE_COMMENT	comment	MySQL extension
DEFINER	definer	MySQL extension
CHARACTER_SET_CLIENT		MySQL extension
COLLATION_CONNECTION		MySQL extension
DATABASE_COLLATION		MySQL extension

Notes:

- MySQL calculates EXTERNAL_LANGUAGE thus:
 - If mysql.proc.language='SQL', EXTERNAL_LANGUAGE is NULL

- Otherwise, EXTERNAL_LANGUAGE is what is in mysql.proc.language. However, we do not have external languages yet, so it is always NULL.
- CREATED: The date and time when the routine was created. This is a TIMESTAMP value.
- LAST_ALTERED: The date and time when the routine was last modified. This is a TIMESTAMP value. If the routine has not been modified since its creation, this column holds the same value as the CREATED column.
- SQL_MODE: The SQL mode in effect when the routine was created or altered, and under which the routine executes. For the permitted values, see Server SQL Modes.
- CHARACTER_SET_CLIENT: The session value of the character_set_client system variable when the routine was created.
- COLLATION_CONNECTION: The session value of the collation_connection system variable when the routine was created.
- DATABASE_COLLATION: The collation of the database with which the routine is associated.
- The DATA_TYPE, CHARACTER_MAXIMUM_LENGTH, CHARACTER_OCTET_LENGTH,

 NUMERIC_PRECISION, NUMERIC_SCALE, DATETIME_PRECISION, CHARACTER_SET_NAME, and

 COLLATION_NAME columns provide information about the data type for the RETURNS clause of

 stored functions. If a stored routine is a stored procedure, these columns all are NULL.
- Information about stored function RETURNS data types is also available in the PARAMETERS table. The return value data type row for a function can be identified as the row that has an ORDINAL_POSITION value of 0.

Chapter 16 The INFORMATION_SCHEMA VIEWS Table

The VIEWS table provides information about views in databases. You must have the SHOW VIEW privilege to access this table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TABLE_CATALOG		def
TABLE_SCHEMA		
TABLE_NAME		
VIEW_DEFINITION		
CHECK_OPTION		
IS_UPDATABLE		
DEFINER		
SECURITY_TYPE		
CHARACTER_SET_CLIENT		MySQL extension
COLLATION_CONNECTION		MySQL extension

Notes:

• The VIEW_DEFINITION column has most of what you see in the Create Table field that SHOW CREATE VIEW produces. Skip the words before SELECT and skip the words WITH CHECK OPTION. Suppose that the original statement was:

```
CREATE VIEW v AS

SELECT s2,s1 FROM t

WHERE s1 > 5

ORDER BY s1

WITH CHECK OPTION;
```

Then the view definition looks like this:

```
SELECT s2,s1 FROM t WHERE s1 > 5 ORDER BY s1
```

- The CHECK_OPTION column has a value of NONE, CASCADE, or LOCAL.
- MySQL sets a flag, called the view updatability flag, at CREATE VIEW time. The flag is set to YES (true) if UPDATE and DELETE (and similar operations) are legal for the view. Otherwise, the flag is set to NO (false). The IS_UPDATABLE column in the VIEWS table displays the status of this flag.

If a view is not updatable, statements such UPDATE, DELETE, and INSERT are illegal and will be rejected. (Note that even if a view is updatable, it might not be possible to insert into it; for details, refer to Updatable and Insertable Views.)

The IS_UPDATABLE flag may be unreliable if a view depends on one or more other views, and one of these underlying views is updated. Regardless of the IS_UPDATABLE value, the server keeps track of the updatability of a view and correctly rejects data change operations to views that are not updatable. If the IS_UPDATABLE value for a view has become inaccurate to due to changes to underlying views, the value can be updated by deleting and recreating the view.

- DEFINER: The account of the user who created the view, in 'user_name'@'host_name' format. SECURITY_TYPE has a value of DEFINER or INVOKER.
- CHARACTER_SET_CLIENT: The session value of the character_set_client system variable when the view was created.

• COLLATION_CONNECTION: The session value of the collation_connection system variable when the view was created.

MySQL lets you use different sql_mode settings to tell the server the type of SQL syntax to support. For example, you might use the ANSI SQL mode to ensure MySQL correctly interprets the standard SQL concatenation operator, the double bar (||), in your queries. If you then create a view that concatenates items, you might worry that changing the sql_mode setting to a value different from ANSI could cause the view to become invalid. But this is not the case. No matter how you write out a view definition, MySQL always stores it the same way, in a canonical form. Here is an example that shows how the server changes a double bar concatenation operator to a CONCAT() function:

The advantage of storing a view definition in canonical form is that changes made later to the value of sql_mode will not affect the results from the view. However an additional consequence is that comments prior to SELECT are stripped from the definition by the server.

Chapter 17 The INFORMATION_SCHEMA TRIGGERS Table

The TRIGGERS table provides information about triggers. To see information about a table's triggers, you must have the TRIGGER privilege for the table.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
TRIGGER_CATALOG		def
TRIGGER_SCHEMA		
TRIGGER_NAME	Trigger	
EVENT_MANIPULATION	Event	
EVENT_OBJECT_CATALOG		def
EVENT_OBJECT_SCHEMA		
EVENT_OBJECT_TABLE	Table	
ACTION_ORDER		
ACTION_CONDITION		NULL
ACTION_STATEMENT	Statement	
ACTION_ORIENTATION		ROW
ACTION_TIMING	Timing	
ACTION_REFERENCE_OLD_TABLE		NULL
ACTION_REFERENCE_NEW_TABLE		NULL
ACTION_REFERENCE_OLD_ROW		OLD
ACTION_REFERENCE_NEW_ROW		NEW
CREATED	Created	
SQL_MODE	sql_mode	MySQL extension
DEFINER	Definer	MySQL extension
CHARACTER_SET_CLIENT	character_set_client	MySQL extension
COLLATION_CONNECTION	collation_connection	MySQL extension
DATABASE_COLLATION	Database Collation	MySQL extension

Notes:

- The names in the "SHOW Name" column refer to the SHOW TRIGGERS statement, not SHOW CREATE TRIGGER. See SHOW TRIGGERS Syntax.
- TRIGGER_SCHEMA and TRIGGER_NAME: The name of the database in which the trigger occurs and the trigger name, respectively.
- EVENT_MANIPULATION: The trigger event. This is the type of operation on the associated table for which the trigger activates. The value is 'INSERT' (a row was inserted), 'DELETE' (a row was deleted), or 'UPDATE' (a row was modified).
- EVENT_OBJECT_SCHEMA and EVENT_OBJECT_TABLE: As noted in Using Triggers, every trigger is associated with exactly one table. These columns indicate the database in which this table occurs, and the table name, respectively.
- ACTION_ORDER: The ordinal position of the trigger's action within the list of triggers on the same table with the same EVENT_MANIPULATION and ACTION_TIMING values. Before MySQL 5.7.2, this value is always 0 because it is not possible for a table to have more than one trigger with the same EVENT_MANIPULATION and ACTION_TIMING values.

- ACTION_STATEMENT: The trigger body; that is, the statement executed when the trigger activates. This text uses UTF-8 encoding.
- ACTION_ORIENTATION: Always contains the value 'ROW'.
- ACTION_TIMING: Whether the trigger activates before or after the triggering event. The value is 'BEFORE' or 'AFTER'.
- ACTION_REFERENCE_OLD_ROW and ACTION_REFERENCE_NEW_ROW: The old and new column
 identifiers, respectively. This means that ACTION_REFERENCE_OLD_ROW always contains the value
 'OLD' and ACTION_REFERENCE_NEW_ROW always contains the value 'NEW'.
- CREATED: The date and time when the trigger was created. This is a TIMESTAMP(2) value (with a fractional part in hundredths of seconds) for triggers created in MySQL 5.7.2 or later, NULL for triggers created prior to 5.7.2.
- SQL_MODE: The SQL mode in effect when the trigger was created, and under which the trigger executes. For the permitted values, see Server SQL Modes.
- DEFINER: The account of the user who created the trigger, in 'user_name'@'host_name' format.
- CHARACTER_SET_CLIENT: The session value of the character_set_client system variable when the trigger was created.
- COLLATION_CONNECTION: The session value of the collation_connection system variable when the trigger was created.
- DATABASE_COLLATION: The collation of the database with which the trigger is associated.
- The following columns currently always contain NULL: ACTION_CONDITION, ACTION_REFERENCE_OLD_TABLE, and ACTION_REFERENCE_NEW_TABLE.

Example, using the ins_sum trigger defined in Using Triggers:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.TRIGGERS
   -> WHERE TRIGGER SCHEMA='test' AND TRIGGER NAME='ins sum'\G
TRIGGER_CATALOG: def
          TRIGGER_SCHEMA: test
            TRIGGER_NAME: ins_sum
       EVENT MANIPULATION: INSERT
     EVENT_OBJECT_CATALOG: def
      EVENT_OBJECT_SCHEMA: test
       EVENT_OBJECT_TABLE: account
            ACTION ORDER: 1
         ACTION_CONDITION: NULL
         ACTION_STATEMENT: SET @sum = @sum + NEW.amount
       ACTION ORIENTATION: ROW
           ACTION_TIMING: BEFORE
ACTION_REFERENCE_OLD_TABLE: NULL
ACTION_REFERENCE_NEW_TABLE: NULL
 ACTION REFERENCE OLD ROW: OLD
 ACTION_REFERENCE_NEW_ROW: NEW
                 CREATED: 2013-07-05 07:41:21.26
                SQL_MODE: NO_ENGINE_SUBSTITUTION
                 DEFINER: me@localhost
     CHARACTER SET CLIENT: utf8
     COLLATION_CONNECTION: utf8_general_ci
       DATABASE_COLLATION: latin1_swedish_ci
```

Chapter 18 The INFORMATION_SCHEMA PLUGINS Table

The PLUGINS table provides information about server plugins.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
PLUGIN_NAME	Name	MySQL extension
PLUGIN_VERSION		MySQL extension
PLUGIN_STATUS	Status	MySQL extension
PLUGIN_TYPE	Type	MySQL extension
PLUGIN_TYPE_VERSION		MySQL extension
PLUGIN_LIBRARY	Library	MySQL extension
PLUGIN_LIBRARY_VERSION		MySQL extension
PLUGIN_AUTHOR		MySQL extension
PLUGIN_DESCRIPTION		MySQL extension
PLUGIN_LICENSE	License	MySQL extension
LOAD_OPTION		MySQL extension

Notes:

- The PLUGINS table is a nonstandard table.
- PLUGIN_NAME is the name used to refer to the plugin in statements such as INSTALL PLUGIN and UNINSTALL PLUGIN.
- PLUGIN_VERSION is the version from the plugin's general type descriptor.
- PLUGIN_STATUS indicates the plugin status, one of ACTIVE, INACTIVE, DISABLED, or DELETED.
- PLUGIN_TYPE indicates the type of plugin, such as STORAGE ENGINE, INFORMATION_SCHEMA, or AUTHENTICATION.
- PLUGIN_TYPE_VERSION is the version from the plugin's type-specific descriptor.
- PLUGIN_LIBRARY is the name of the plugin shared library file. This is the name used to refer to the plugin file in statements such as INSTALL PLUGIN and UNINSTALL PLUGIN. This file is located in the directory named by the plugin_dir system variable. If the library name is NULL, the plugin is compiled in and cannot be uninstalled with UNINSTALL PLUGIN.
- PLUGIN_LIBRARY_VERSION indicates the plugin API interface version.
- PLUGIN_AUTHOR names the plugin author.
- PLUGIN_DESCRIPTION provides a short description of the plugin.
- PLUGIN_LICENSE indicates how the plugin is licensed; for example, GPL.
- LOAD_OPTION indicates how the plugin was loaded. The value is OFF, ON, FORCE, or FORCE_PLUS_PERMANENT. See Installing and Uninstalling Plugins.

For plugins installed with INSTALL PLUGIN, the PLUGIN_NAME and PLUGIN_LIBRARY values are also registered in the mysql.plugin table.

These statements are equivalent:

```
SELECT
PLUGIN_NAME, PLUGIN_STATUS, PLUGIN_TYPE,
```

PLUGIN_LIBRARY, PLUGIN_LICENSE FROM INFORMATION_SCHEMA.PLUGINS; SHOW PLUGINS;

For information about plugin data structures that form the basis of the information in the PLUGINS table, see The MySQL Plugin API.

Plugin information is also available using the ${ t SHOW}$ PLUGINS statement. See SHOW PLUGINS Syntax.

Chapter 19 The INFORMATION_SCHEMA ENGINES Table

The ENGINES table provides information about storage engines.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
ENGINE	Engine	MySQL extension
SUPPORT	Support	MySQL extension
COMMENT	Comment	MySQL extension
TRANSACTIONS	Transactions	MySQL extension
XA	XA	MySQL extension
SAVEPOINTS	Savepoints	MySQL extension

Notes:

• The ENGINES table is a nonstandard table. Its contents correspond to the columns of the SHOW ENGINES statement. For descriptions of its columns, see SHOW ENGINES Syntax.

See also SHOW ENGINES Syntax.

1	Λ
4	v

Chapter 20 The INFORMATION_SCHEMA PARTITIONS Table

The PARTITIONS table provides information about table partitions. See Partitioning, for more information about partitioning tables.

INFORMATION_SCHEMA Name	sноw Name	Remarks
TABLE_CATALOG		MySQL extension
TABLE_SCHEMA		MySQL extension
TABLE_NAME		MySQL extension
PARTITION_NAME		MySQL extension
SUBPARTITION_NAME		MySQL extension
PARTITION_ORDINAL_POSITION		MySQL extension
SUBPARTITION_ORDINAL_POSITION		MySQL extension
PARTITION_METHOD		MySQL extension
SUBPARTITION_METHOD		MySQL extension
PARTITION_EXPRESSION		MySQL extension
SUBPARTITION_EXPRESSION		MySQL extension
PARTITION_DESCRIPTION		MySQL extension
TABLE_ROWS		MySQL extension
AVG_ROW_LENGTH		MySQL extension
DATA_LENGTH		MySQL extension
MAX_DATA_LENGTH		MySQL extension
INDEX_LENGTH		MySQL extension
DATA_FREE		MySQL extension
CREATE_TIME		MySQL extension
UPDATE_TIME		MySQL extension
CHECK_TIME		MySQL extension
CHECKSUM		MySQL extension
PARTITION_COMMENT		MySQL extension
NODEGROUP		MySQL extension
TABLESPACE_NAME		MySQL extension

Notes:

- The PARTITIONS table is a nonstandard table.
 - Each record in this table corresponds to an individual partition or subpartition of a partitioned table.
- TABLE_CATALOG: This column is always def.
- TABLE_SCHEMA: This column contains the name of the database to which the table belongs.
- TABLE_NAME: This column contains the name of the table containing the partition.
- PARTITION_NAME: The name of the partition.
- SUBPARTITION_NAME: If the PARTITIONS table record represents a subpartition, then this column contains the name of subpartition; otherwise it is NULL.

- PARTITION_ORDINAL_POSITION: All partitions are indexed in the same order as they are defined, with 1 being the number assigned to the first partition. The indexing can change as partitions are added, dropped, and reorganized; the number shown is this column reflects the current order, taking into account any indexing changes.
- SUBPARTITION_ORDINAL_POSITION: Subpartitions within a given partition are also indexed and reindexed in the same manner as partitions are indexed within a table.
- PARTITION_METHOD: One of the values RANGE, LIST, HASH, LINEAR HASH, KEY, or LINEAR KEY; that is, one of the available partitioning types as discussed in Partitioning Types.
- SUBPARTITION_METHOD: One of the values HASH, LINEAR HASH, KEY, or LINEAR KEY; that is, one of the available subpartitioning types as discussed in Subpartitioning.
- PARTITION_EXPRESSION: This is the expression for the partitioning function used in the CREATE TABLE or ALTER TABLE statement that created the table's current partitioning scheme.

For example, consider a partitioned table created in the test database using this statement:

```
CREATE TABLE tp (
   c1 INT,
   c2 INT,
   c3 VARCHAR(25)
)

PARTITION BY HASH(c1 + c2)

PARTITIONS 4;
```

The PARTITION_EXPRESSION column in a PARTITIONS table record for a partition from this table displays c1 + c2, as shown here:

• SUBPARTITION_EXPRESSION: This works in the same fashion for the subpartitioning expression that defines the subpartitioning for a table as PARTITION_EXPRESSION does for the partitioning expression used to define a table's partitioning.

If the table has no subpartitions, then this column is NULL.

• PARTITION_DESCRIPTION: This column is used for RANGE and LIST partitions. For a RANGE partition, it contains the value set in the partition's VALUES LESS THAN clause, which can be either an integer or MAXVALUE. For a LIST partition, this column contains the values defined in the partition's VALUES IN clause, which is a comma-separated list of integer values.

For partitions whose PARTITION_METHOD is other than RANGE or LIST, this column is always NULL.

• TABLE_ROWS: The number of table rows in the partition.

For partitioned InnoDB tables, the row count given in the TABLE_ROWS column is only an estimated value used in SQL optimization, and may not always be exact.

• AVG_ROW_LENGTH: The average length of the rows stored in this partition or subpartition, in bytes.

This is the same as DATA_LENGTH divided by TABLE_ROWS.

• DATA_LENGTH: The total length of all rows stored in this partition or subpartition, in bytes—that is, the total number of bytes stored in the partition or subpartition.

- MAX_DATA_LENGTH: The maximum number of bytes that can be stored in this partition or subpartition.
- INDEX_LENGTH: The length of the index file for this partition or subpartition, in bytes.
- DATA_FREE: The number of bytes allocated to the partition or subpartition but not used.
- CREATE_TIME: The time of the partition's or subpartition's creation.

Prior to MySQL 5.7.8, for partitioned InnoDB tables, this column was always NULL. The correct creation time is shown in MySQL 5.7.8 and later. (Bug #17299181, Bug #69990)

• UPDATE TIME: The time that the partition or subpartition was last modified.

Prior to MySQL 5.7.8, for partitioned InnoDB tables, this column was always NULL. The correct modification time is shown in MySQL 5.7.8 and later. (Bug #17299181, Bug #69990)

• CHECK_TIME: The last time that the table to which this partition or subpartition belongs was checked.

For partitioned Innode tables, this column is always NULL.

- CHECKSUM: The checksum value, if any; otherwise, this column is NULL.
- PARTITION_COMMENT: This column contains the text of any comment made for the partition.

In MySQL 5.7, the maximum length for a partition comment is defined as 1024 characters, and the display width of the PARTITION_COMMENT column is also 1024, characters to match this limit (Bug #11748924, Bug #37728).

The default value for this column is an empty string.

- NODEGROUP: This is the nodegroup to which the partition belongs. This is relevant only to MySQL Cluster tables: otherwise the value of this column is always 0.
- TABLESPACE_NAME: This column contains the name of the tablespace to which the partition belongs. The value of this column is always DEFAULT.
- A nonpartitioned table has one record in INFORMATION_SCHEMA.PARTITIONS; however, the values of the PARTITION_NAME, SUBPARTITION_NAME, PARTITION_ORDINAL_POSITION, SUBPARTITION_ORDINAL_POSITION, PARTITION_METHOD, SUBPARTITION_METHOD, PARTITION_EXPRESSION, SUBPARTITION_EXPRESSION, and PARTITION_DESCRIPTION columns are all NULL. (The PARTITION_COMMENT column in this case is blank.)

44		
44		

Chapter 21 The INFORMATION_SCHEMA EVENTS Table

The EVENTS table provides information about scheduled events, which are discussed in Using the Event Scheduler. The SHOW Name values correspond to column names of the SHOW EVENTS statement.

INFORMATION_SCHEMA Name	SHOW Name	Remarks
EVENT_CATALOG		def, MySQL extension
EVENT_SCHEMA	Db	MySQL extension
EVENT_NAME	Name	MySQL extension
DEFINER	Definer	MySQL extension
TIME_ZONE	Time zone	MySQL extension
EVENT_BODY		MySQL extension
EVENT_DEFINITION		MySQL extension
EVENT_TYPE	Туре	MySQL extension
EXECUTE_AT	Execute at	MySQL extension
INTERVAL_VALUE	Interval value	MySQL extension
INTERVAL_FIELD	Interval field	MySQL extension
SQL_MODE		MySQL extension
STARTS	Starts	MySQL extension
ENDS	Ends	MySQL extension
STATUS	Status	MySQL extension
ON_COMPLETION		MySQL extension
CREATED		MySQL extension
LAST_ALTERED		MySQL extension
LAST_EXECUTED		MySQL extension
EVENT_COMMENT		MySQL extension
ORIGINATOR	Originator	MySQL extension
CHARACTER_SET_CLIENT	character_set_client	MySQL extension
COLLATION_CONNECTION	collation_connection	MySQL extension
DATABASE_COLLATION	Database Collation	MySQL extension

Notes:

- The EVENTS table is a nonstandard table.
- EVENT_CATALOG: The value of this column is always def.
- EVENT_SCHEMA: The name of the schema (database) to which this event belongs.
- EVENT_NAME: The name of the event.
- DEFINER: The account of the user who created the event, in 'user_name' @'host_name' format.
- TIME_ZONE: The event time zone, which is the time zone used for scheduling the event and that is in effect within the event as it executes. The default value is SYSTEM.
- EVENT_BODY: The language used for the statements in the event's DO clause; in MySQL 5.7, this is always SQL.

This column is not to be confused with the column of the same name (now named EVENT_DEFINITION) that existed in earlier MySQL versions.

- EVENT_DEFINITION: The text of the SQL statement making up the event's DO clause; in other words, the statement executed by this event.
- EVENT_TYPE: The event repetition type, either ONE TIME (transient) or RECURRING (repeating).
- EXECUTE_AT: For a one-time event, this is the DATETIME value specified in the AT clause of the CREATE EVENT statement used to create the event, or of the last ALTER EVENT statement that modified the event. The value shown in this column reflects the addition or subtraction of any INTERVAL value included in the event's AT clause. For example, if an event is created using ON SCHEDULE AT CURRENT_TIMESTAMP + '1:6' DAY_HOUR, and the event was created at 2006-02-09 14:05:30, the value shown in this column would be '2006-02-10 20:05:30'.

If the event's timing is determined by an EVERY clause instead of an AT clause (that is, if the event is recurring), the value of this column is NULL.

 INTERVAL_VALUE: For recurring events, this column contains the numeric portion of the event's EVERY clause.

For a one-time event (that is, an event whose timing is determined by an AT clause), this column is NULL.

• INTERVAL_FIELD: For recurring events, this column contains the units portion of the EVERY clause governing the timing of the event. Thus, this column contains a value such as 'YEAR', 'QUARTER', 'DAY', and so on.

For a one-time event (that is, an event whose timing is determined by an AT clause), this column is

- SQL_MODE: The SQL mode in effect when the event was created or altered, and under which the
 event executes. For the permitted values, see Server SQL Modes.
- STARTS: For a recurring event whose definition includes a STARTS clause, this column contains
 the corresponding DATETIME value. As with the EXECUTE_AT column, this value resolves any
 expressions used.

If there is no STARTS clause affecting the timing of the event, this column is NULL

ENDS: For a recurring event whose definition includes a ENDS clause, this column contains the
corresponding DATETIME value. As with the EXECUTE_AT column, this value resolves any
expressions used.

If there is no ENDS clause affecting the timing of the event, this column is NULL.

STATUS: One of the three values ENABLED, DISABLED, or SLAVESIDE_DISABLED.

SLAVESIDE_DISABLED indicates that the creation of the event occurred on another MySQL server acting as a replication master and was replicated to the current MySQL server which is acting as a slave, but the event is not presently being executed on the slave. See Replication of Invoked Features, for more information.

- ON_COMPLETION: One of the two values PRESERVE or NOT PRESERVE.
- CREATED: The date and time when the event was created. This is a TIMESTAMP value.
- LAST_ALTERED: The date and time when the event was last modified. This is a TIMESTAMP value.
 If the event has not been modified since its creation, this column holds the same value as the CREATED column.

• LAST_EXECUTED: The date and time when the event last executed. A DATETIME value. If the event has never executed, this column is NULL.

LAST_EXECUTED indicates when the event started. As a result, the ENDS column is never less than LAST_EXECUTED.

- EVENT_COMMENT: The text of a comment, if the event has one. If not, the value of this column is an empty string.
- ORIGINATOR: The server ID of the MySQL server on which the event was created; used in replication. The default value is 0.
- CHARACTER_SET_CLIENT: The session value of the character_set_client system variable when the event was created.
- COLLATION_CONNECTION: The session value of the collation_connection system variable when the event was created.
- DATABASE COLLATION: The collation of the database with which the event is associated.

Example: Suppose that the user jon@ghidora creates an event named e_daily, and then modifies it a few minutes later using an ALTER EVENT statement, as shown here:

```
DELIMITER |

CREATE EVENT e_daily

ON SCHEDULE

EVERY 1 DAY

COMMENT 'Saves total number of sessions then clears the table each day'

DO

BEGIN

INSERT INTO site_activity.totals (time, total)

SELECT CURRENT_TIMESTAMP, COUNT(*)

FROM site_activity.sessions;

DELETE FROM site_activity.sessions;

END |

DELIMITER;

ALTER EVENT e_daily

ENABLE;
```

(Note that comments can span multiple lines.)

This user can then run the following SELECT statement, and obtain the output shown:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.EVENTS
    > WHERE EVENT_NAME = 'e_daily'
    > AND EVENT_SCHEMA = 'myschema'\G
        ******* 1. row ****
      EVENT_CATALOG: def
       EVENT SCHEMA: test
         EVENT_NAME: e_daily
            DEFINER: me@localhost
          TIME_ZONE: SYSTEM
         EVENT_BODY: SQL
    EVENT_DEFINITION: BEGIN
       INSERT INTO site_activity.totals (time, total)
         SELECT CURRENT_TIMESTAMP, COUNT(*)
           FROM site_activity.sessions;
       DELETE FROM site_activity.sessions;
     END
         EVENT_TYPE: RECURRING
         EXECUTE AT: NULL
      INTERVAL_VALUE: 1
      INTERVAL_FIELD: DAY
           SQL_MODE:
             STARTS: 2008-09-03 12:13:39
               ENDS: NULL
```

```
STATUS: ENABLED

ON_COMPLETION: NOT PRESERVE

CREATED: 2008-09-03 12:13:39

LAST_ALTERED: 2008-09-03 12:13:39

LAST_EXECUTED: NULL

EVENT_COMMENT: Saves total number of sessions then clears the table each day

ORIGINATOR: 1

CHARACTER_SET_CLIENT: latin1

COLLATION_CONNECTION: latin1_swedish_ci

DATABASE_COLLATION: latin1_swedish_ci
```

Times in the EVENTS table are displayed using the event time zone or the current session time zone, as described in Event Metadata.

See also SHOW EVENTS Syntax.

Chapter 22 The INFORMATION_SCHEMA FILES Table

The FILES table provides information about the files in which MySQL tablespace data is stored.

INFORMATION_SCHEMA.FILES provides information about InnoDB data files (MySQL 5.7.8 and later). In MySQL Cluster this table also provides information about the files in which MySQL Cluster Disk Data tables are stored. For information specific to InnoDB, see InnoDB Notes, later in this section; for information specific to MySQL Cluster, see NDB Notes.

INFORMATION_SCHEMA Name	SHOW Name	Remarks

InnoDB Notes

The following notes apply to InnoDB data files. INFORMATION_SCHEMA.FILES fields that are not described below are not applicable to InnoDB and report a NULL value.

- Data reported by INFORMATION_SCHEMA.FILES is reported from the InnoDB in-memory cache for open files. By comparison, INFORMATION_SCHEMA.INNODB_SYS_DATAFILES reports data from the InnoDB SYS_DATAFILES internal data dictionary table.
- The data reported by INFORMATION_SCHEMA.FILES includes temporary tablespace data. This data
 is not available in the internal SYS_DATAFILES data dictionary table, and is therefore not reported by
 INNODB_SYS_DATAFILES.
- Undo tablespace data is reported by INFORMATION_SCHEMA.FILES when separate undo tablespaces are configured using the innodb_undo_tablespaces configuration option.
- FILE_ID is the tablespace ID, also referred to as the space_id or fil_space_t::id.
- FILE_NAME is the name of the data file. File-per-table and general tablespaces have a .ibd file name extension. Undo tablespaces are prefixed by undo. The system tablespace is prefixed by ibdata. Temporary tablespaces are prefixed by ibtmp. The file name includes the file path, which may be relative to the MySQL data directory (datadir).
- FILE_TYPE is the tablespace file type. There are three possible file types for InnoDB files.

 TABLESPACE is the file type for any system, general, or file-per-table tablespace file that holds tables, indexes, or other forms of user data. TEMPORARY is the file type for temporary tablespaces.

 UNDO LOG is the file type for undo log tablespaces, which hold undo records. By default, undo records are stored in the system tablespace. Separate undo log tablespaces can be added using the innodb_undo_tablespaces option.
- TABLESPACE_NAME is the SQL name for the tablespace. A general tablespace name is the SYS_TABLESPACES.NAME value. For other tablespace files, names start with innodb_, such as innodb_system, innodb_undo, and innodb_file_per_table. The file-per-table tablespace name format is innodb file per table ##, where ## is the tablespace ID.
- ENGINE is the storage engine. For InnoDB files, the value is always InnoDB.
- FREE_EXTENTS is the number of fully free extents in the current data file.
- TOTAL_EXTENTS is the number of full extents used in the current data file. Any partial extent at the
 end of the file is not counted.
- EXTENT_SIZE is 1048576 (1MB) for files with a 4k, 8k, or 16k page size. Extent size is 2097152 bytes (2MB) for files with a 32k page size, and 4194304 (4MB) for files with a 64k page size. INFORMATION_SCHEMA.FILES does not report InnoDB page size. Page size is defined by the innodb_page_size option. Extent size information can also be retrieved from INNODB_SYS_TABLESPACES where FILES.FILE_ID = INNODB_SYS_TABLESPACES.SPACE_ID.
- INITIAL_SIZE is the initial size of the file, in bytes.
- MAXIMUM_SIZE is the maximum number of bytes allowed in the file. The value is NULL for all data
 files except for predefined system tablespace data files. Maximum system tablespace file size is
 defined by innodb_data_file_path. Maximum temporary tablespace file size is defined by
 innodb_temp_data_file_path. A NULL value for a predefined system tablespace data file
 indicates that a file size limit was not defined explicitly.

- AUTOEXTEND_SIZE is the auto-extend size defined by innodb_data_file_path for the system tablespace, or defined by innodb_temp_data_file_path for temporary tablespaces.
- DATA_FREE is the total amount of free space (in bytes) for the entire tablespace. Predefined system
 tablespaces, which include the system tablespace and temporary table tablespaces, may have one
 or more data files.
- STATUS is NORMAL by default. InnoDB file-per-table tablespaces may report IMPORTING, which indicates that the tablespace is not yet available.
- The following query returns all data pertinent to InnoDB tablespaces.

```
mysql> select file_id, file_name, file_type, tablespace_name, free_extents, total_extents, extent_size, initial_size, maximum_size, autoextend_size, data_free, status engine from information_schema.files \G
```

NDB Notes

- The FILES table provides information about Disk Data files only; you cannot use it for determining
 disk space allocation or availability for individual NDB tables. However, it is possible to see how much
 space is allocated for each NDB table having data stored on disk—as well as how much remains
 available for storage of data on disk for that table—using ndb_desc. For more information, see
 ndb_desc Describe NDB Tables.
- FILE_ID column values are auto-generated.
- FILE_NAME is the name of an UNDO log file created by CREATE LOGFILE GROUP or ALTER LOGFILE GROUP, or of a data file created by CREATE TABLESPACE or ALTER TABLESPACE.
- FILE_TYPE is one of the values UNDOFILE, DATAFILE, or TABLESPACE.
- TABLESPACE_NAME is the name of the tablespace with which the file is associated.
- Currently, the value of the TABLESPACE CATALOG column is always NULL.
- TABLE_NAME is the name of the Disk Data table with which the file is associated, if any.
- The LOGFILE_GROUP_NAME column gives the name of the log file group to which the log file or data file belongs.
- For an UNDO log file, the LOGFILE_GROUP_NUMBER contains the auto-generated ID number of the log file group to which the log file belongs.
- For a MySQL Cluster Disk Data log file or data file, the value of the ENGINE column is always NDB or NDBCLUSTER.
- For a MySQL Cluster Disk Data log file or data file, the value of the FULLTEXT_KEYS column is always empty.
- The FREE EXTENTS column displays the number of extents which have not yet been used by the file. The TOTAL EXTENTS column show the total number of extents allocated to the file.

The difference between these two columns is the number of extents currently in use by the file:

```
SELECT TOTAL_EXTENTS - FREE_EXTENTS AS extents_used

FROM INFORMATION_SCHEMA.FILES

WHERE FILE_NAME = 'myfile.dat';
```

You can approximate the amount of disk space in use by the file by multiplying this difference by the value of the EXTENT SIZE column, which gives the size of an extent for the file in bytes:

```
SELECT (TOTAL_EXTENTS - FREE_EXTENTS) * EXTENT_SIZE AS bytes_used FROM INFORMATION_SCHEMA.FILES
```

```
WHERE FILE_NAME = 'myfile.dat';
```

Similarly, you can estimate the amount of space that remains available in a given file by multiplying FREE EXTENTS by EXTENT SIZE:

```
SELECT FREE_EXTENTS * EXTENT_SIZE AS bytes_free
FROM INFORMATION_SCHEMA.FILES
WHERE FILE_NAME = 'myfile.dat';
```

Important

The byte values produced by the preceding queries are approximations only, and their precision is inversely proportional to the value of EXTENT_SIZE. That is, the larger EXTENT_SIZE becomes, the less accurate the approximations are.

It is also important to remember that once an extent is used, it cannot be freed again without dropping the data file of which it is a part. This means that deletes from a Disk Data table do *not* release disk space.

The extent size can be set in a CREATE TABLESPACE statement. See CREATE TABLESPACE Syntax, for more information.

• The INITIAL_SIZE column shows the size in bytes of the file. This is the same value that was used in the INITIAL_SIZE clause of the CREATE LOGFILE GROUP, ALTER LOGFILE GROUP, CREATE TABLESPACE, or ALTER TABLESPACE statement used to create the file.

For MySQL Cluster Disk Data files, the value of the MAXIMUM_SIZE column is always the same as INITIAL_SIZE, and the AUTOEXTEND_SIZE column is always empty.

• The CREATION_TIME column shows the date and time when the file was created. The LAST_UPDATE_TIME column displays the date and time when the file was last modified. The LAST_ACCESSED column provides the date and time when the file was last accessed by the server.

Currently, the values of these columns are as reported by the operating system, and are not supplied by the NDB storage engine. Where no value is provided by the operating system, these columns display 0000-00-00 00:00:00.

- For MySQL Cluster Disk Data files, the value of the RECOVER_TIME and TRANSACTION_COUNTER columns is always 0.
- For MySQL Cluster Disk Data files, the following columns are always NULL:
 - VERSION
 - ROW_FORMAT
 - TABLE_ROWS
 - AVG ROW LENGTH
 - DATA_LENGTH
 - MAX_DATA_LENGTH
 - INDEX_LENGTH
 - DATA_FREE
 - CREATE_TIME
 - UPDATE_TIME

- CHECK_TIME
- CHECKSUM
- For MySQL Cluster Disk Data files, the value of the STATUS column is always NORMAL.
- For MySQL Cluster Disk Data files, the EXTRA column shows which data node the file belongs to, as each data node has its own copy of the file. Suppose that you use this statement on a MySQL Cluster with four data nodes:

```
CREATE LOGFILE GROUP mygroup

ADD UNDOFILE 'new_undo.dat'

INITIAL_SIZE 2G

ENGINE NDB;
```

After running the CREATE LOGFILE GROUP statement successfully, you should see a result similar to the one shown here for this query against the FILES table:

- The FILES table is a nonstandard table.
- An additional row is present in the FILES table following the creation of a logfile group. This row has NULL for the value of the FILE_NAME column. For this row, the value of the FILE_ID column is always 0, that of the FILE_TYPE column is always UNDO FILE, and that of the STATUS column is always NORMAL. Currently, the value of the ENGINE column is always NDBCLUSTER.

The FREE_EXTENTS column in this row shows the total number of free extents available to all undo files belonging to a given log file group whose name and number are shown in the LOGFILE_GROUP_NAME and LOGFILE_GROUP_NUMBER columns, respectively.

Suppose there are no existing log file groups on your MySQL Cluster, and you create one using the following statement:

```
mysql> CREATE LOGFILE GROUP lg1
   -> ADD UNDOFILE 'undofile.dat'
   -> INITIAL_SIZE = 16M
   -> UNDO_BUFFER_SIZE = 1M
   -> ENGINE = NDB;
Query OK, 0 rows affected (3.81 sec)
```

You can now see this NULL row when you query the FILES table:

The total number of free extents available for undo logging is always somewhat less than the sum of the TOTAL_EXTENTS column values for all undo files in the log file group due to overhead required for maintaining the undo files. This can be seen by adding a second undo file to the log file group, then repeating the previous query against the FILES table:

```
mysql> ALTER LOGFILE GROUP 1g1
  -> ADD UNDOFILE 'undofile02.dat'
      INITIAL_SIZE = 4M
  -> ENGINE = NDB;
Query OK, 0 rows affected (1.02 sec)
mysql> SELECT DISTINCT
   -> FILE_NAME AS File,
  -> FREE_EXTENTS AS Free,
  -> TOTAL_EXTENTS AS Total,
      EXTENT_SIZE AS Size,
     INITIAL_SIZE AS Initial
  ->
  -> FROM INFORMATION_SCHEMA.FILES;
| File | Free | Total | Size | Initial |
3 rows in set (0.01 sec)
```

The amount of free space in bytes which is available for undo logging by Disk Data tables using this log file group can be approximated by multiplying the number of free extents by the initial size:

```
mysql> SELECT

-> FREE_EXTENTS AS 'Free Extents',
-> FREE_EXTENTS * EXTENT_SIZE AS 'Free Bytes'
-> FROM INFORMATION_SCHEMA.FILES
-> WHERE LOGFILE_GROUP_NAME = 'lg1'
-> AND FILE_NAME IS NULL;
+------+
| Free Extents | Free Bytes |
+------+
| 5223944 | 20895776 |
+------+
1 row in set (0.02 sec)
```

If you create a MySQL Cluster Disk Data table and then insert some rows into it, you can see approximately how much space remains for undo logging afterward, for example:

```
mysql> CREATE TABLESPACE ts1
   -> ADD DATAFILE 'data1.dat'
   -> USE LOGFILE GROUP lg1
   -> INITIAL_SIZE 512M
   -> ENGINE = NDB;
Query OK, 0 rows affected (8.71 sec)
mysql> CREATE TABLE dd (
   -> c1 INT NOT NULL PRIMARY KEY,
   -> c2 INT,
   -> c3 DATE
   -> )
   -> TABLESPACE ts1 STORAGE DISK
   -> ENGINE = NDB;
Query OK, 0 rows affected (2.11 sec)
mysql> INSERT INTO dd VALUES
   -> (NULL, 1234567890, '2007-02-02'),
```

- An additional row is present in the FILES table for any MySQL Cluster tablespace, whether or not
 any data files are associated with the tablespace. This row has NULL for the value of the FILE_NAME
 column. For this row, the value of the FILE_ID column is always 0, that of the FILE_TYPE column
 is always TABLESPACE, and that of the STATUS column is always NORMAL. Currently, the value of
 the ENGINE column is always NDBCLUSTER.
- There are no SHOW statements associated with the FILES table.
- For additional information, and examples of creating and dropping MySQL Cluster Disk Data objects, see MySQL Cluster Disk Data Tables.

Chapter 23 The INFORMATION_SCHEMA PROCESSLIST Table

The PROCESSLIST table provides information about which threads are running.

INFORMATION_SCHEMA Name	sноw Name	Remarks
ID	Id	MySQL extension
USER	User	MySQL extension
HOST	Host	MySQL extension
DB	db	MySQL extension
COMMAND	Command	MySQL extension
TIME	Time	MySQL extension
STATE	State	MySQL extension
INFO	Info	MySQL extension

For an extensive description of the table columns, see SHOW PROCESSLIST Syntax.

Notes:

- The PROCESSLIST table is a nonstandard table.
- Like the output from the corresponding SHOW statement, the PROCESSLIST table will only show information about your own threads, unless you have the PROCESS privilege, in which case you will see information about other threads, too. As an anonymous user, you cannot see any rows at all.
- If an SQL statement refers to INFORMATION_SCHEMA.PROCESSLIST, MySQL populates the entire table once, when statement execution begins, so there is read consistency during the statement. There is no read consistency for a multi-statement transaction, though.
- Process information is also available from the performance_schema.threads table. However, access to threads does not require a mutex and has minimal impact on server performance.
 INFORMATION_SCHEMA.PROCESSLIST and SHOW PROCESSLIST have negative performance consequences because they require a mutex. threads also shows information about background threads, which INFORMATION_SCHEMA.PROCESSLIST and SHOW PROCESSLIST do not. This means that threads can be used to monitor activity the other thread information sources cannot.

The following statements are equivalent:

SELECT * FROM INFORMATION_SCHEMA.PROCESSLIST SHOW FULL PROCESSLIST

58			

Chapter 24 The INFORMATION_SCHEMA REFERENTIAL_CONSTRAINTS Table

The REFERENTIAL_CONSTRAINTS table provides information about foreign keys.

INFORMATION_SCHEMA Name	sноw Name	Remarks
CONSTRAINT_CATALOG		def
CONSTRAINT_SCHEMA		
CONSTRAINT_NAME		
UNIQUE_CONSTRAINT_CATALOG		def
UNIQUE_CONSTRAINT_SCHEMA		
UNIQUE_CONSTRAINT_NAME		
MATCH_OPTION		
UPDATE_RULE		
DELETE_RULE		
TABLE_NAME		
REFERENCED_TABLE_NAME		

Notes:

- TABLE_NAME has the same value as TABLE_NAME in INFORMATION_SCHEMA.TABLE_CONSTRAINTS.
- CONSTRAINT_SCHEMA and CONSTRAINT_NAME identify the foreign key.
- UNIQUE_CONSTRAINT_SCHEMA, UNIQUE_CONSTRAINT_NAME, and REFERENCED_TABLE_NAME identify the referenced key.
- The only valid value at this time for MATCH_OPTION is NONE.
- The possible values for update_rule or delete_rule are Cascade, set null, set default, restrict, no action.

Chapter 25 The INFORMATION_SCHEMA GLOBAL_STATUS and SESSION_STATUS Tables

Note

As of MySQL 5.7.6, the value of the show_compatibility_56 system variable affects the information available from the tables described here. For details, see the description of that variable in Server System Variables.

Note

As of MySQL 5.7.6, information available from the tables described here is also available from the Performance Schema. The INFORMATION_SCHEMA tables are deprecated in preference to the Performance Schema tables and will be removed in a future MySQL release. For advice on migrating away from the INFORMATION_SCHEMA tables to the Performance Schema tables, see Migrating to Performance Schema System and Status Variable Tables.

The GLOBAL_STATUS and SESSION_STATUS tables provide information about server status variables. Their contents correspond to the information produced by the SHOW GLOBAL STATUS and SHOW SESSION STATUS statements (see SHOW STATUS Syntax).

INFORMATION_SCHEMA Name	sноw Name	Remarks
VARIABLE_NAME	Variable_name	
VARIABLE_VALUE	Value	

Notes:

• The VARIABLE_VALUE column for each of these tables is defined as VARCHAR (1024).

62		

Chapter 26 The INFORMATION_SCHEMA GLOBAL_VARIABLES and SESSION_VARIABLES Tables

Note

As of MySQL 5.7.6, the value of the show_compatibility_56 system variable affects the information available from the tables described here. For details, see the description of that variable in Server System Variables.

Note

As of MySQL 5.7.6, information available from the tables described here is also available from the Performance Schema. The INFORMATION_SCHEMA tables are deprecated in preference to the Performance Schema tables and will be removed in a future MySQL release. For advice on migrating away from the INFORMATION_SCHEMA tables to the Performance Schema tables, see Migrating to Performance Schema System and Status Variable Tables.

The GLOBAL_VARIABLES and SESSION_VARIABLES tables provide information about server status variables. Their contents correspond to the information produced by the SHOW GLOBAL VARIABLES and SHOW SESSION VARIABLES statements (see SHOW VARIABLES Syntax).

INFORMATION_SCHEMA Name	sноw Name	Remarks
VARIABLE_NAME	Variable_name	
VARIABLE_VALUE	Value	

Notes:

• The VARIABLE_VALUE column for each of these tables is defined as VARCHAR (1024). For variables with very long values that are not completely displayed, use SELECT as a workaround. For example:

SELECT @@GLOBAL.innodb_data_file_path;

Chapter 27 Extensions to SHOW Statements

Some extensions to SHOW statements accompany the implementation of INFORMATION_SCHEMA:

- SHOW can be used to get information about the structure of INFORMATION_SCHEMA itself.
- Several SHOW statements accept a WHERE clause that provides more flexibility in specifying which
 rows to display.

INFORMATION_SCHEMA is an information database, so its name is included in the output from SHOW DATABASES. Similarly, SHOW TABLES can be used with INFORMATION_SCHEMA to obtain a list of its tables:

```
mysql> SHOW TABLES FROM INFORMATION SCHEMA;
Tables_in_INFORMATION_SCHEMA
 CHARACTER_SETS
 COLLATIONS
 COLLATION_CHARACTER_SET_APPLICABILITY
 COLUMN_PRIVILEGES
 ENGINES
 EVENTS
 FILES
 GLOBAL_STATUS
 GLOBAL_VARIABLES
 KEY_COLUMN_USAGE
 PARTITIONS
 PROCESSLIST
 REFERENTIAL_CONSTRAINTS
 ROUTINES
 SCHEMATA
 SCHEMA_PRIVILEGES
 SESSION_STATUS
 SESSION_VARIABLES
 STATISTICS
 TABLES
 TABLE CONSTRAINTS
 TABLE_PRIVILEGES
 TRIGGERS
 USER PRIVILEGES
27 rows in set (0.00 sec)
```

SHOW COLUMNS and DESCRIBE can display information about the columns in individual INFORMATION_SCHEMA tables.

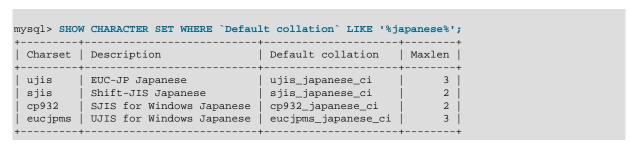

SHOW statements that accept a LIKE clause to limit the rows displayed also permit a WHERE clause that specifies more general conditions that selected rows must satisfy:

```
SHOW CHARACTER SET
SHOW COLLATION
SHOW COLUMNS
SHOW DATABASES
SHOW FUNCTION STATUS
SHOW INDEX
SHOW OPEN TABLES
SHOW PROCEDURE STATUS
SHOW STATUS
SHOW TABLE STATUS
SHOW TABLE STATUS
SHOW TABLES
SHOW TABLES
SHOW TABLES
SHOW TABLES
SHOW VARIABLES
```

The WHERE clause, if present, is evaluated against the column names displayed by the SHOW statement. For example, the SHOW CHARACTER SET statement produces these output columns:

mysql> SHOW	CHARACTER SET;		
Charset	Description	Default collation	Maxlen
big5	Big5 Traditional Chinese	big5_chinese_ci	2
dec8	DEC West European	dec8_swedish_ci	1
cp850	DOS West European	cp850_general_ci	1
hp8	HP West European	hp8_english_ci	1
koi8r	KOI8-R Relcom Russian	koi8r_general_ci	1
latin1	cp1252 West European	latin1_swedish_ci	1
latin2	ISO 8859-2 Central European	latin2_general_ci	1
•••			

To use a WHERE clause with SHOW CHARACTER SET, you would refer to those column names. As an example, the following statement displays information about character sets for which the default collation contains the string 'japanese':

This statement displays the multibyte character sets:

Charset	Description	Default collation	Maxlen
big5	Big5 Traditional Chinese	big5_chinese_ci	2
ujis	EUC-JP Japanese	ujis_japanese_ci	3
sjis	Shift-JIS Japanese	sjis_japanese_ci	2
euckr	EUC-KR Korean	euckr_korean_ci	2
gb2312	GB2312 Simplified Chinese	gb2312_chinese_ci	2
gbk	GBK Simplified Chinese	gbk_chinese_ci	2
utf8	UTF-8 Unicode	utf8_general_ci	3
ucs2	UCS-2 Unicode	ucs2_general_ci	2
cp932	SJIS for Windows Japanese	cp932_japanese_ci	2
eucjpms	UJIS for Windows Japanese	eucjpms_japanese_ci	j 3 j

Chapter 28 MySQL 5.7 FAQ: INFORMATION_SCHEMA

Questions

- 28.1: Where can I find documentation for the MySQL INFORMATION_SCHEMA database?
- 28.2: Is there a discussion forum for INFORMATION_SCHEMA?
- 28.3: Where can I find the ANSI SQL 2003 specification for INFORMATION SCHEMA?
- 28.4: What is the difference between the Oracle Data Dictionary and MySQL's INFORMATION_SCHEMA?
- 28.5: Can I add to or otherwise modify the tables found in the INFORMATION_SCHEMA database?

Questions and Answers

28.1: Where can I find documentation for the MySQL INFORMATION SCHEMA database?

See Chapter 1, INFORMATION_SCHEMA Tables

28.2: Is there a discussion forum for INFORMATION_SCHEMA?

See http://forums.mysql.com/list.php?101.

28.3: Where can I find the ANSI SQL 2003 specification for INFORMATION_SCHEMA?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available—such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer—which give a comprehensive overview of the standard, including INFORMATION_SCHEMA.

28.4: What is the difference between the Oracle Data Dictionary and MySQL's INFORMATION SCHEMA?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. MySQL's implementation is more similar to those found in DB2 and SQL Server, which also support INFORMATION_SCHEMA as defined in the SQL standard.

28.5: Can I add to or otherwise modify the tables found in the INFORMATION_SCHEMA database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, we cannot support bugs or other issues which result from modifying INFORMATION_SCHEMA tables or data.
