

NAME

ExtUtils::MM_Cygwin - methods to override UN*X behaviour in ExtUtils::MakeMaker

SYNOPSIS

```
use ExtUtils::MM_Cygwin; # Done internally by ExtUtils::MakeMaker if
needed
```

DESCRIPTION

See ExtUtils::MM_Unix for a documentation of the methods provided there.

`os_flavor`

We're Unix and Cygwin.

`cflags`

if configured for dynamic loading, triggers #define EXT in EXTERN.h

`replace_manpage_separator`

replaces strings '::' with '.' in MAN*POD man page names

`init_linker`

points to libperl.a

`maybe_command`

Determine whether a file is native to Cygwin by checking whether it resides inside the Cygwin installation (using Windows paths). If so, use `ExtUtils::MM_Unix` to determine if it may be a command. Otherwise use the tests from `ExtUtils::MM_Win32`.

`dynamic_lib`

Use the default to produce the *.dll's. But for new archdir dll's use the same rebase address if the old exists.

`all_target`

Build man pages, too
