

#### **Abstract**

This is the MySQL™ Workbench Reference Manual. It documents the MySQL Workbench Community and MySQL Workbench Commercial Editions 6.3 through 6.3.10.

If you have not yet installed the MySQL Workbench Community Edition, please download your free copy from the download site. The MySQL Workbench Community Edition is available for Microsoft Windows, macOS, and Linux.

For notes detailing the changes in each release, see the MySQL Workbench Release Notes.

For legal information, see the Legal Notices.

For help with using MySQL, please visit either the MySQL Forums or MySQL Mailing Lists, where you can discuss your issues with other MySQL users.

For additional documentation on MySQL products, including translations of the documentation into other languages, and downloadable versions in variety of formats, including HTML and PDF formats, see the MySQL Documentation Library.

**Licensing information.** This product may include third-party software, used under license. If you are using MySQL Workbench Commercial Editions, see this document for licensing information, including licensing information relating to third-party software that may be included in this Commercial Edition release. If you are using the MySQL Workbench Community Edition, see this document for licensing information, including licensing information relating to third-party software that may be included in this Community Edition release.

1 What Is New in MySQL Workbench 6	1
1.1.1 New in MySQL Workbench 6.3	
1.1.2 New in MySQL Workbench 6.2	
1.1.3 New in MySQL Workbench 6.1	
1.1.4 New in MySQL Workbench 6.0	
.2 MySQL Workbench Editions	

This chapter provides general information about MySQL Workbench and how it has changed.

MySQL Workbench is a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL server versions 5.5 and higher. It is also compatible with older MySQL server 5.x versions, except in certain situations (like displaying the process list) due to changed system tables. It does not support MySQL server versions 4.x.

MySQL Workbench functionality covers five main topics:

- SQL Development: Enables you to create and manage connections to database servers. Along with
  enabling you to configure connection parameters, MySQL Workbench provides the capability to execute
  SQL queries on the database connections using the built-in SQL Editor.
- Data Modeling (Design): Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration**: Enables you to administer MySQL server instances by administering users, performing backup and recovery, inspecting audit data, viewing database health, and monitoring the MySQL server performance.
- Data Migration: Allows you to migrate from Microsoft SQL Server, Microsoft Access, Sybase ASE, SQLite, SQL Anywhere, PostreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.
- MySQL Enterprise Support: Support for Enterprise products such as MySQL Enterprise Backup, MySQL Firewall, and MySQL Audit.

MySQL Workbench is available in two editions: the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as access to MySQL Enterprise Backup, MySQL Firewall, and MySQL Audit. For a complete comparison, see <a href="http://www.mysql.com/products/workbench/features.html">http://www.mysql.com/products/workbench/features.html</a>

For notes detailing the changes in each release, see the MySQL Workbench Release Notes.

# 1.1 What Is New in MySQL Workbench 6

This section summarizes how the MySQL Workbench 6 series progressed with each minor release.

For notes detailing the changes in each point release, see the MySQL Workbench Release Notes.

### 1.1.1 New in MySQL Workbench 6.3

This section summarizes many of the new features added to MySQL Workbench 6.3.x, in relation to MySQL Workbench 6.2.x;.

### **MySQL**

- Full MySQL 5.7 language support was added, which affects grammar, syntax highlighting, preferences, behavior, and more.
- The bundled sakila\_full.mwb model now uses a dedicated 5.7 version to allow for 5.7 specific features, regardless of the version setting in the preferences.
- The JSON editor was improved with better parsing and error checking.
- The option to specify an alternative application data directory, instead of the default location, was added.
- Dropped support for MySQL 5.1. Minimum version is now MySQL 5.5.
- Dropped Fabric support in MySQL Workbench 6.3.9; support in older versions of MySQL Workbench is unchanged.
- Dropped support for DBDesigner 4.

### **User Interface Changes**

• The home screen was modified: the connections, models, and starters were split into individual pages.

### **User Preference Changes**

A new Log Level preference (under Others) was added to alter the log verbosity level.

As before, this can still be set by passing in the log-level command-line argument into Workbench at runtime, and doing so overrides the **Log Level** setting.

### Package and Build Related Changes

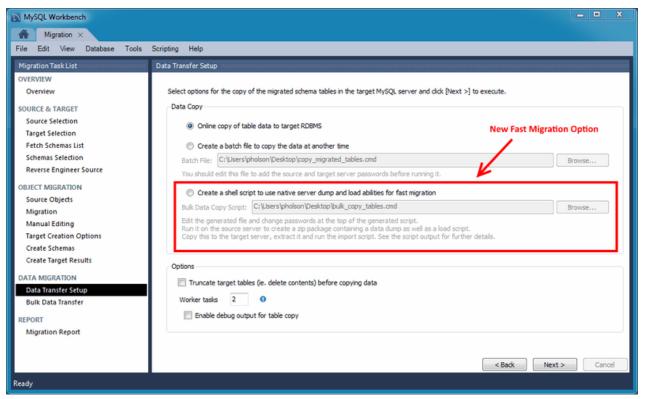

- Linux: Fedora 23 support dropped, Fedora 25 support added. Oracle Linux 6 support was dropped.
- Windows: Zip packages and 32-bit binaries are no longer published. The .NET Framework version 4.5 is now required.
- OS X / macOS: Version 10.7 (Lion) and 10.8 (Mountain Lion) support was dropped. Now supporting versions 10.9 (Mavericks), 10.10 (Yosemite), 10.11 (El Capitan), and 10.12 (Sierra).
- Changed to GTK 3 on Linux.
- Changed to C++11.

### **Fast Data Migration**

A new "fast migration" option was added to the migration wizard. This is another way to transfer data from one MySQL server to another while performing a migration, and it complements the existing solutions. The premise is to use a generated script on the source server to create a dump that you move to the target machine to perform the import there. This avoids the need to traffic all data through MySQL Workbench, or to have a permanent network connection between the servers. Instead, the dump and restore is

performed at maximum speed by using the LOAD DATA call for the MySQL import. The migration wizard automatically creates all necessary scripts for all supported platforms and servers. The generated script creates a self-contained Zip file that must be copied to the target server. You unzip it and execute the provided script to perform the data import.

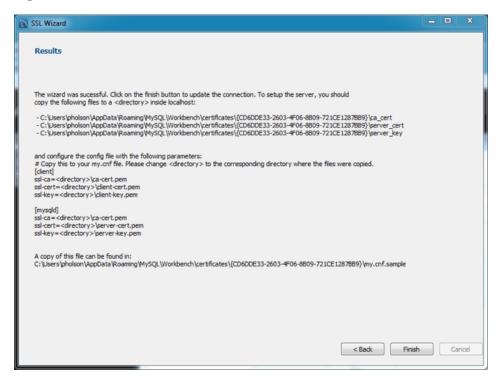

#### **SSL Certificate Generator**

A new SSL certificate generation wizard was added. This new wizard helps create proper SSL certificates for both MySQL clients and MySQL servers. Connections in MySQL Workbench are updated with the certificates by the wizard. This wizard requires OpenSSL to create the certificates. An example my.cnf/my.ini file is also generated that utilizes the generated certificates.

Figure 1.2 SSL Certificate Wizard

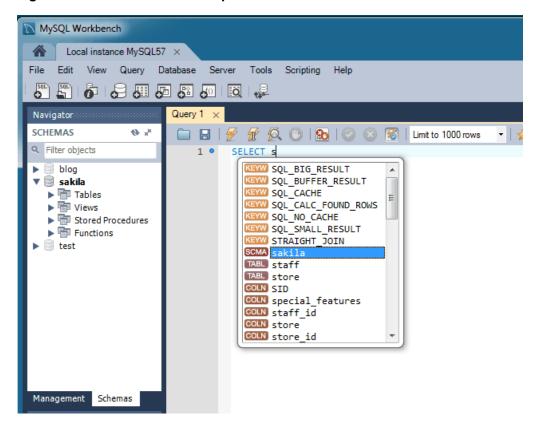

For additional details, see Section 5.3.4, "SSL Wizard (Certificates)".

### **SQL Editor Auto-Completion**

The SQL editor auto-completion improvements include the following changes:

- It now functions with all statement types, when before only SELECT statements were fully supported.
- It now minds the MySQL server version. For example, it now only shows the engines available from the server.
- Additional suggestions are now available, such as system variables, engines, table spaces, logfile groups, and more.
- New graphics including color coded (and tagged) entries.
- It is context aware, as for example it only shows available keywords, columns, and tables.
- Improved MySQL 5.7 syntax support.

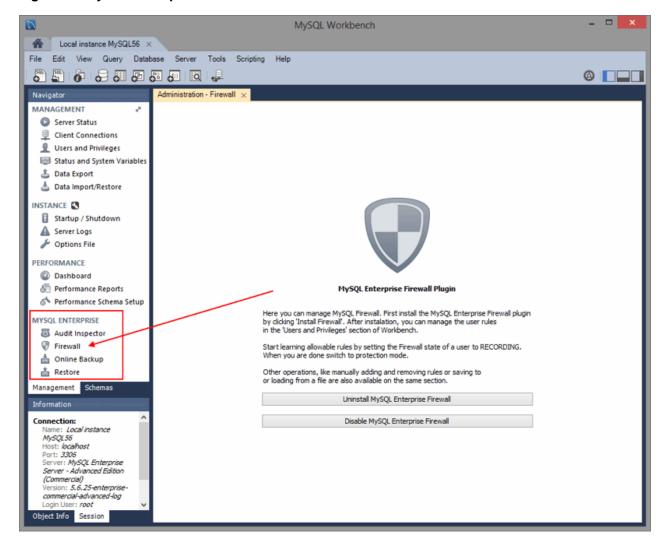

Figure 1.3 SQL Editor Auto-Completion

## **MySQL Enterprise Firewall**

MySQL Enterprise Firewall support was added in MySQL Workbench 6.3.4. Use MySQL Workbench to install and enable MySQL Enterprise Firewall, and manage the MySQL Enterprise Firewall rules and variables. For additional information, see Section 6.8, "MySQL Enterprise Firewall Interface".

Figure 1.4 MySQL Enterprise Firewall: Install / Enable

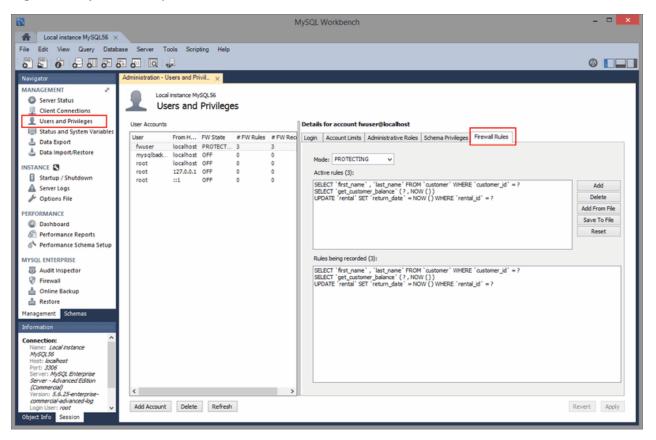

Figure 1.5 MySQL Enterprise Firewall Rules

### MySQL Enterprise Backup

Profile handling now detects mismatches between MySQL Enterprise Backup executables and corresponding profiles.

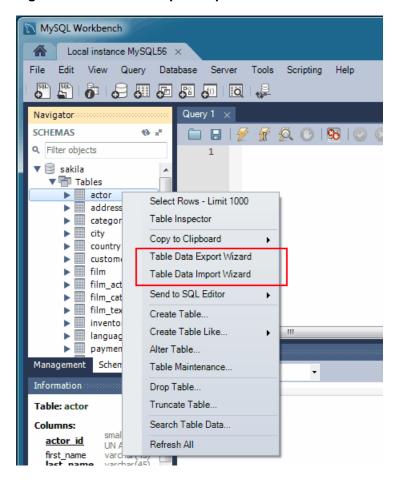

Improved scheduling logic

### Table Data Export and Import Wizard

A new table data import/export wizard was added. This feature enhances the current CSV import and export feature found in the SQL editor's result set viewer. It supports import and export of CSV and JSON files, and allows a more flexible configuration (separators, column selection, encoding selection, and more). This new wizard does not require an executed statement on a table for a result set to be operated on, as it can now work directly on tables. The wizard can be performed against either a local or remotely connected MySQL server. The import action includes table, column, and type mapping. For additional information, see Section 6.5.1, "Table Data Export and Import Wizard".

The wizard is accessible from the object browser's context menu.

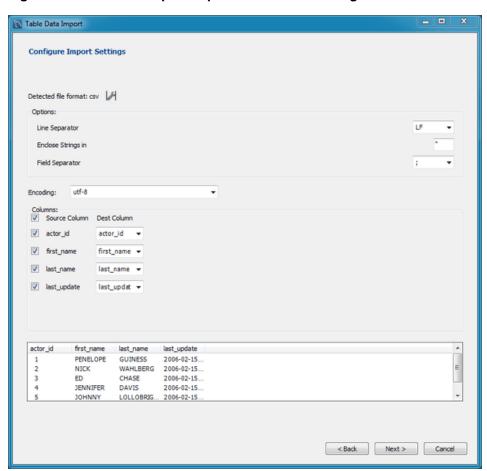

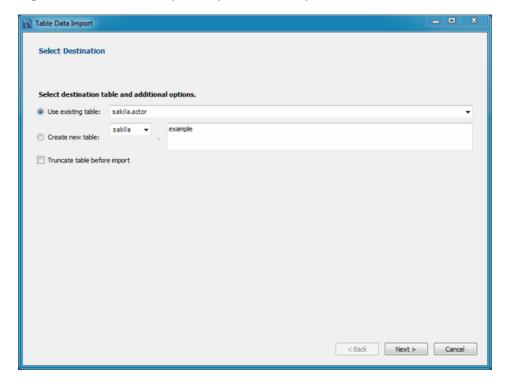

Figure 1.7 Table Data Import/Export Wizard CSV Configure

Figure 1.8 Table Data Import/Export Wizard Options

## **Additional Changes**

MySQL Fabric 1.5 is now supported. Older versions of Fabric are no longer supported due to incompatible protocol changes.

OS X / macOS builds were switched from 32-bit to 64-bit.

Platforms support changes: 6.3.0: Fedora 21 and Ubuntu 14.10 support was added, Ubuntu 12.10 support was dropped. 6.3.4: Fedora 22 and Ubuntu 15.04 support was added, Ubuntu 14.10 support was dropped.

# 1.1.2 New in MySQL Workbench 6.2

This section summarizes many of the new features added to MySQL Workbench 6.2.x, in relation to MySQL Workbench 6.1.x;.

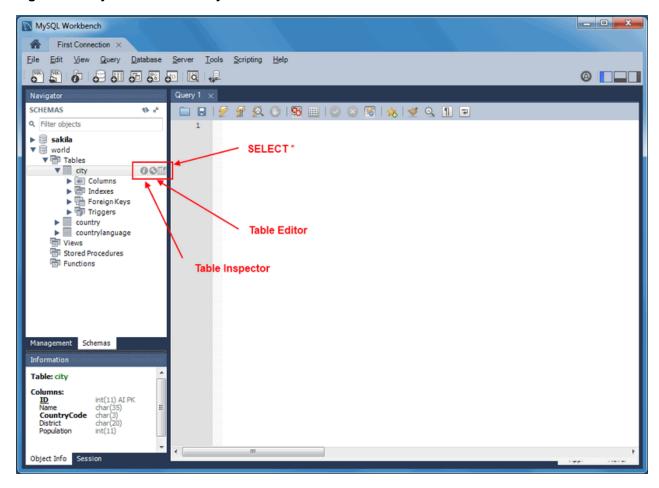

#### **SQL** Editor

Most of the changes and improvements were made to the SQL editor.

### **Overlay Icons in the Object Viewer**

The schema navigator now includes shortcut buttons for common operations such as table data view, the table editor, and the table/schema inspector.

Figure 1.9 Object Viewer Overlay Icons

### A "Pin Tab" Results Option

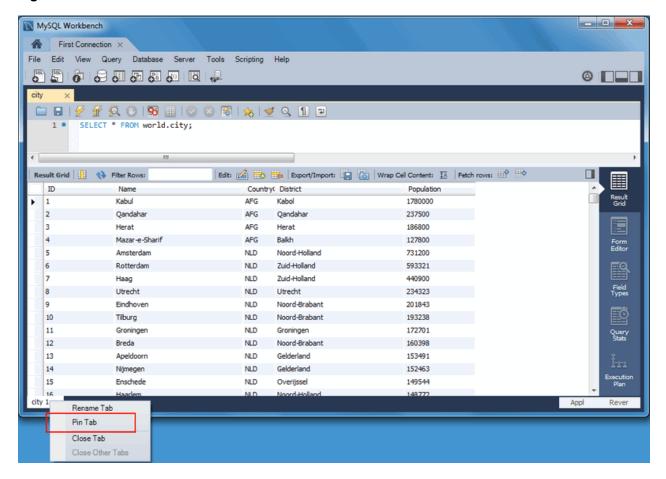

Result tabs can now be "pinned" to your result set window.

#### Note

The "Rename Tab" context menu option is also new. New names are preserved (and remembered) in your Workbench's cache/ directory.

Figure 1.10 Pin Tab

### **Microsoft Access to MySQL Migration**

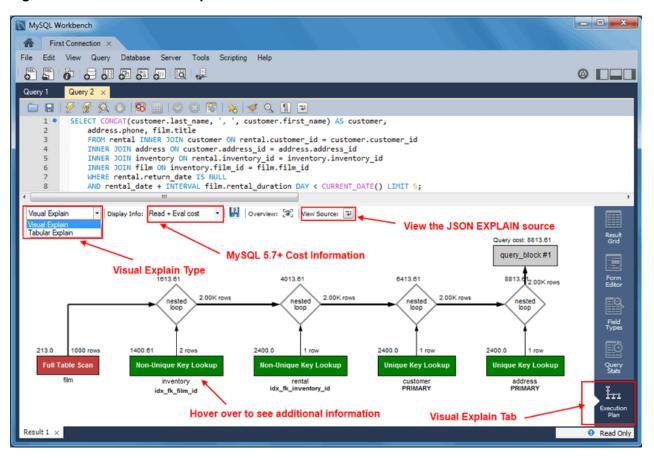

The migration wizard now supports Microsoft Access migration. Select "Microsoft Access" as your source database in the wizard, use MySQL as your target source database, and then execute. For additional information, see Section 10.4, "Microsoft Access Migration".

### **Visual Explain / Execution Plan Improvements**

The Visual Explain **Execution Plan** feature was improved. A list of changes includes:

- · An "Execution Plan" tab was added to the results view
- All statements now offer a "Visual Explain" execution plan
- The layout changed, and was improved to allow easier navigation in large query plans

Figure 1.11 Execution Plan Explained

### **Spatial View Panel**

GIS support for InnoDB tables is now supported to make it easier to visualize spatial and geometry data in a geographic context. The new spatial view panel renders data from each row into a separate and selectable element. When clicked, you can view the rest of the data from that row in the textbox. If you have multiple queries with geometry data, you can overlay them onto the same map. View options include the Robinson, Mercator, Equirectangular, and Bonne projection methods.

#### **Note**

GIS support for InnoDB tables was added in MySQL server 5.7.

### **Geometry Data Viewer**

The SQL field and form editors were updated to support the GEOMETRY datatype. You can view geometry data, such as polygons, from a single row as an image or as text. The available formats include WKT, GeoJSON, GML, and KML.

#### Additional New SQL Editor Features

- **Result Set Widths**: resized result set column widths are now preserved and remembered. This data is saved under Workbench's cache/ directory using the *schema.table.column* format.
- Opened, closed, and reordered SQL editor tabs are now properly saved and restored. The scroll position and cursor locations are also remembered.
- **Shared Snippets**: these allow multiple users to share SQL code across a shared MySQL connection. They are stored in a schema named .mysqlworkbench on the connected MySQL server. by storing the snippets in a shared MySQL instance. For additional information, see Section 8.1.5, "SQL Snippets Tab".
- The full SQL syntax error is now viewable by hovering over the error response message.
- The Query Status tab was improved to include graphs and additional information.

#### **Execute SQL Scripts**

The new **Run SQL Script** dialog executes an SQL script without loading it into the SQL editor. This is useful because loading large scripts for editing can cause performance problems related to increased memory usage and required processing for editor features such as syntax highlighting, syntax checking, and code-folding. The dialog lets you preview a part of the script, optionally specify a default schema, and optionally set the default character set to use for the imported data. The output window shows warnings, messages, and an execution progression bar. Select **Run SQL Script** from the **File** menu to execute this wizard.

### **Model Script Attachments**

Previously, MySQL Workbench modeling supported attaching SQL script files to models, usually for documentation and organization purposes. You can now include attached SQL files to the output script when performing forward engineering or synchronization operations.

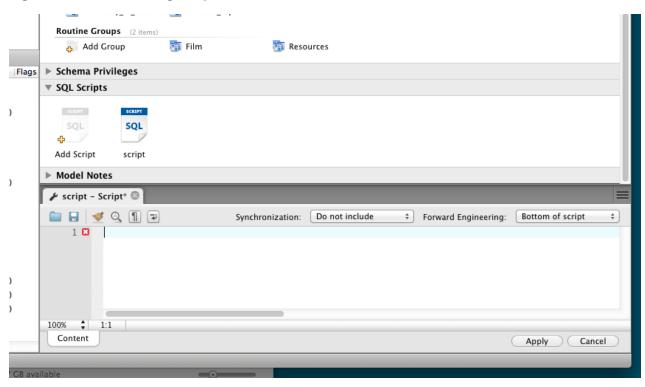

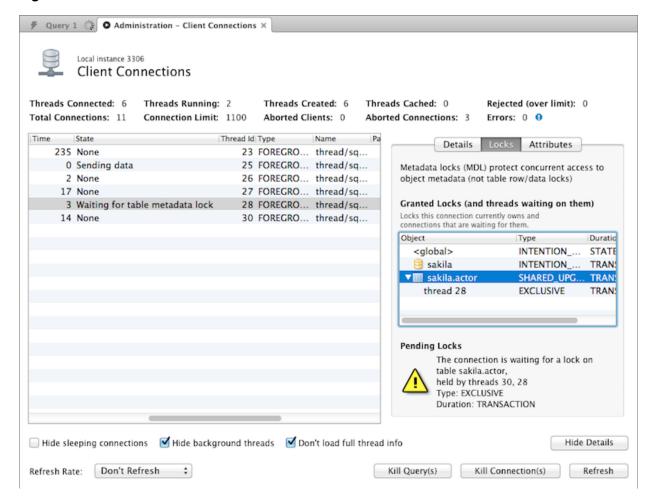

Figure 1.15 Data Modeling Script Attachments

#### **Client Connections and Metadata locks**

The **Client Connections** management window has a new **Show Details** window. This window's three tabs are:

- **Details**: connection details such as Process ID, Type, User, Host, Instrumented, and additional information.
- Locks: MySQL uses metadata locking to manage access to objects such as tables and triggers.
   Sometimes a query might be blocked while being manipulated by another connection from another user.
   The Locks feature utilizes these MySQL metadata locks (MDL) to show the locked connections that are blocked or being waiting on, and shows information about the locks, what they are waiting for, and what they hold.

Figure 1.16 Metadata Locks Browser

#### Note

The metadata lock information is provided in the performance schema as of MySQL server 5.7.3.

#### Note

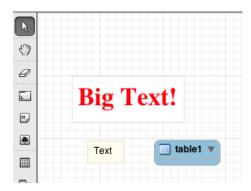

This feature uses performance schema details from MySQL server 5.7 and above.

For additional information, see Section 5.4, "Client Connections".

#### **Additional New Features**

- Performance columns (that display sizes) now have an option to alter the value units. They can be set to KB, MB, or GB. Right-click on a column header and choose **Set Display Unit**.
- The migration wizard can now resume operation if a data copy failed during a database migration from, for example, a timeout or network failure. Click **Resume** retry the data copy, and MySQL Workbench locates the last row that was copied successfully and attempts to restart the copy from that row.
- The MySQL connection password is now remembered across the MySQL Workbench session, even if it
  not stored in the keychain. This is so you do not need to re-enter it whenever a new MySQL connection
  is needed.
- Under Modeling, the Role Editor now has "Add Everything" and "Check All Privileges" options.
- The Preferences layout changed. The tabs were replaced by a list using a horizontal sidebar, and additional category names were added. For additional information, see Section 3.2, "Workbench Preferences".
- · Keyboard shortcuts now function in the Scripting Shell.
- **Model diagram notes** can now be resized and automatically rearranged. You can also change the style attributes such as the font, background color, and text color.

# 1.1.3 New in MySQL Workbench 6.1

This section summarizes many of the new features added to MySQL Workbench 6.1.x, in relation to MySQL Workbench 6.0.x;.

### **New Navigator PERFORMANCE Section**

The new **PERFORMANCE** section includes **Dashboard**, **Performance Reports**, and **Performance Schema Setup** pages. Generally, this new performance reporting feature provides a graphical representation of key statistics from the MySQL server status, and provides an overview of the MySQL server subsystems.

#### **Query Stats**

Query statistics are taken from the Performance Schema, and includes information about timing, temporary tables, indexes, joins, and more.

Figure 1.27 SQL Editor: Query Stats

#### **Home Screen Features**

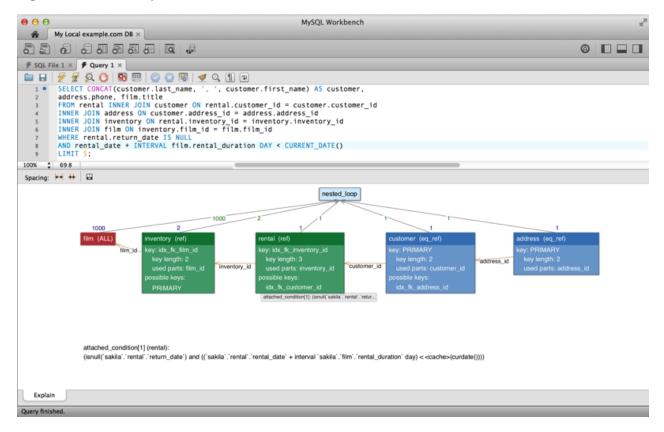

Several behavioral improvements were made to the MySQL Workbench home screen, including:

- · Connection tiles can now be repositioned by using drag and drop
- A script or model file can be dragged into a MySQL connection tile
- The following right-click options were added to the connection tiles: Copy JDBC Connection String and Copy Connection String
- Right-clicking a blank area in the MySQL Connections area now offers an option to create a New Connection From Clipboard

## Visual Explain

The layout changed, and additional information is now viewable by hovering over the fields. It also displays traditional EXPLAIN output in a separate tab, and the **Raw Explain Data** (as JSON) in another. For MySQL server 5.7+, the new "cost information" (such as "query\_cost" and "sort\_cost) is also utilized.

### **Additional Client Connection Information**

Additional information was added to the **Client Connections** tab, such as Thread ID, Parent Thread, Instrumented, and Type.

### **Additional Miscellaneous Additions**

- MSAA (Windows Accessibility API) support and High contrast color theme in Microsoft Windows
- MySQL Enterprise Backup improvements
- · Improvements with general performance and overall stability

## 1.1.4 New in MySQL Workbench 6.0

This section summarizes many of the new features added to MySQL Workbench 6.0.0, in relation to MySQL Workbench 5.2.x;.

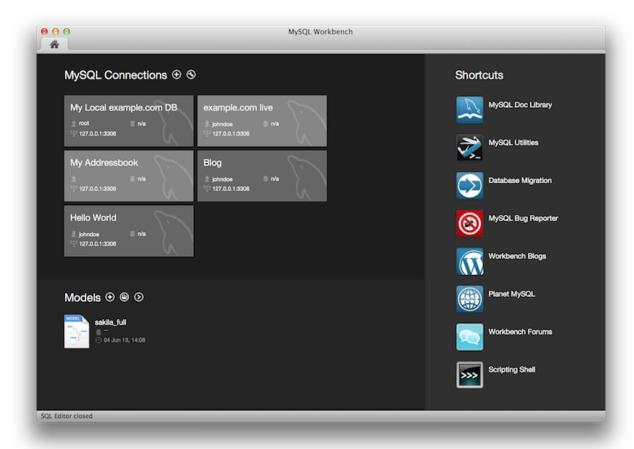

### A New Home Screen

A new, modernized home screen where major functionality of MySQL Workbench can be accessed, including connections to MySQL servers, modeling, migration, and the command-line utilities.

Figure 1.34 Home Screen: Workbench 5.2

Figure 1.35 Home Screen: Workbench 6.0

## **Unified SQL Editor and Administration Interface**

In the new user interface, the Server Administration functionality (such as start/stop server, managing user accounts etc) is now accessible directly from the SQL Editor interface, located near where the schema information can be browsed and queries executed.

The image below contains three screenshots of the Schema window in the SQL Editor. The first is from MySQL Workbench 5.2, the second is MySQL Workbench 6.0 with the management tab collapsed, and the third shows what the merged management tab looks like. Toggle the merged and tabbed views by clicking the new merge button next to the refresh button.

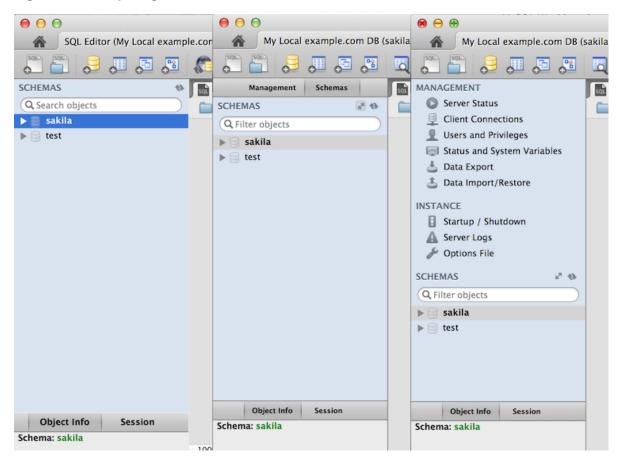

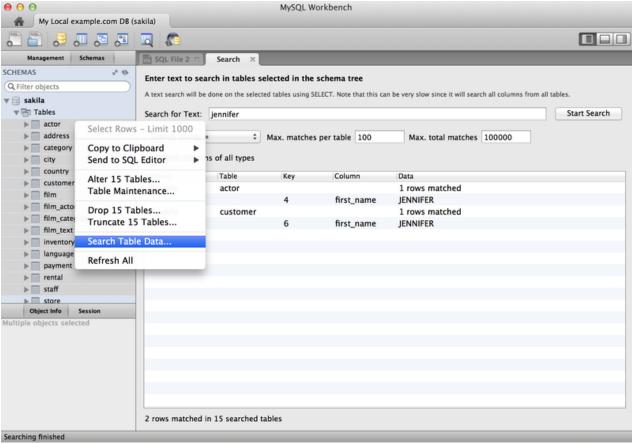

Figure 1.36 Comparing the SQL Editor interface for Workbench 5.2 and 6.0

### **Table Data Search**

You can select schemas, tables, or both to perform client-side searches for user specified strings and patterns. To access this new search feature, right click select a schema or a table in the left sidebar and select **Search Table Data...**.

This screenshot demonstrates the search feature, along with an example search. Multiple tables were selected and searched in this example:

Figure 1.37 Table search functionality

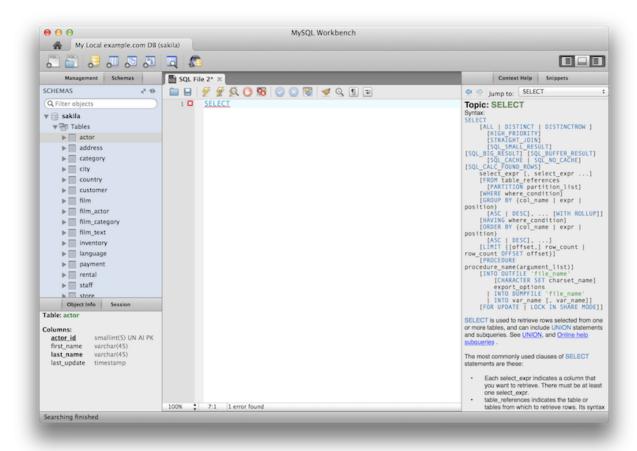

For additional information, see Section 8.1.8, "Table Data Search Panel".

## Context Sensitive Help for the SQL Editor

Select a keyword or function in your query and after a delay it will show formatted help information from the MySQL Server (equivalent to using the help command from the command-line MySQL Client).

Figure 1.38 Context Sensitive Help

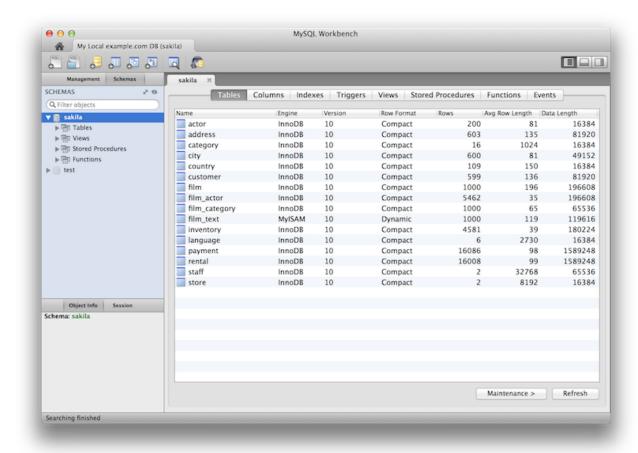

For additional information, see Section 8.1.6, "Context Sensitive Help".

### **Schema Inspector**

New Schema Inspector feature allows you to browse general information from schema objects. For tables, it's also possible to perform maintenance tasks such as ANALYZE, OPTIMIZE, CHECK, and CHECKSUM TABLE. To access the inspector, right-click a schema and select the **Schema Inspector** 

Figure 1.39 Schema Inspector

And choosing **Maintenance** for a table:

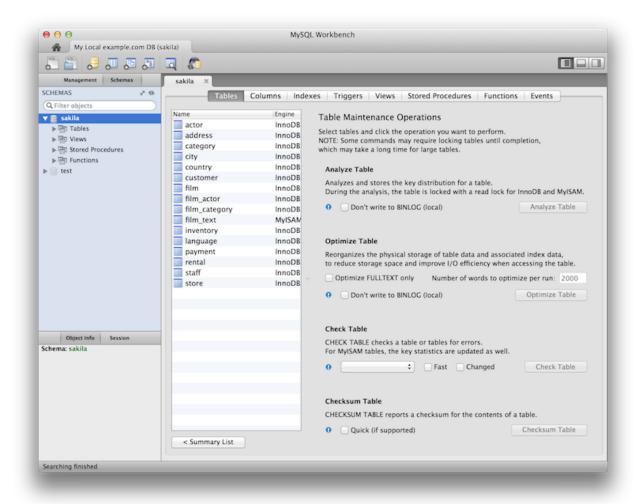

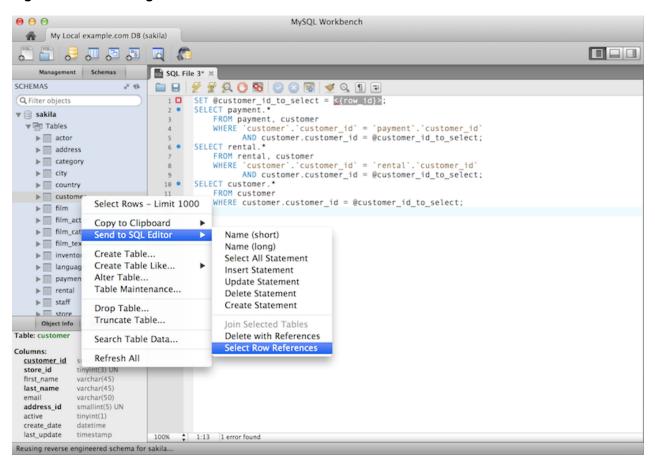

Figure 1.40 Schema Inspector: Maintenance

For additional information, see Schema Inspector.

### **Cascaded DELETE Statements Generator**

You can generate a series of DELETE statements needed to delete a row from that table, which includes rows from other tables that reference it, recursively. The SELECT version allows you to preview what rows would be deleted. Right click a table and select **Copy to Clipboard**, **Delete with References**.

Figure 1.41 Cascading SELECT

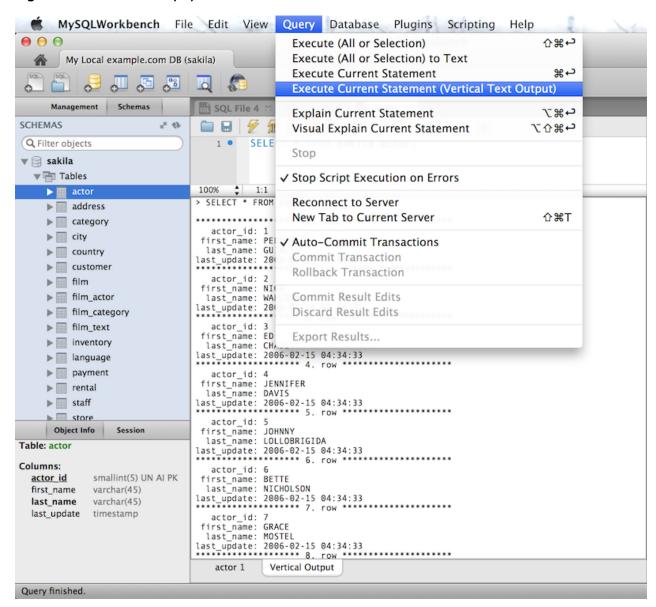

### **Table Templates**

Define templates of tables with commonly used columns, to be used to create new tables in a live connection or in an EER model. In the SQL Editor, choose **Create Table Like...**, or in Modeling, use the right sidebar. For additional information, see Section 9.6, "Table Templates".

#### **Vertical Text**

A Vertical Text output option for queries (equivalent to \G from the command-line Client) was added. To execute, choose **Query**, **Execute Current Statement (Vertical Text Output)**.

Figure 1.42 Vertical Text (\G)

## Improved Visual Explain

The Visual Explain output was improved.

Figure 1.43 Visual Explain: Workbench 5.2

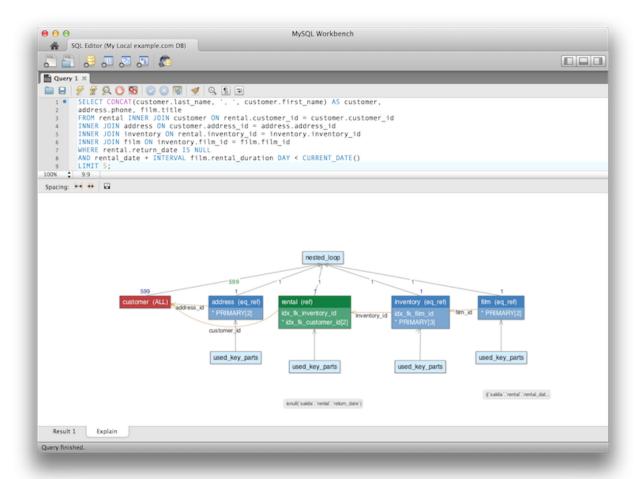

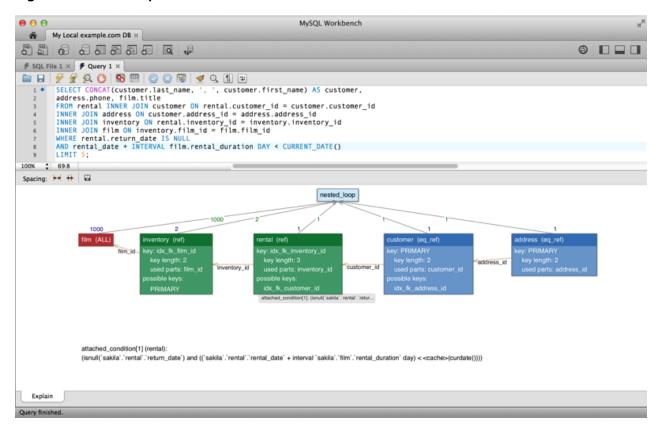

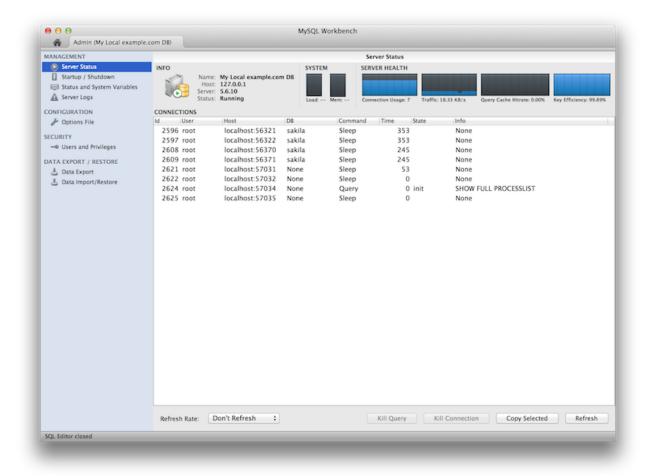

Figure 1.44 Visual Explain: Workbench 6.0

## **Improved Server Status**

Additional server status information was added, and the user interface was improved. Select **Server Status** from the **Management** tab to open this window.

Figure 1.45 Server Status: Workbench 5.2

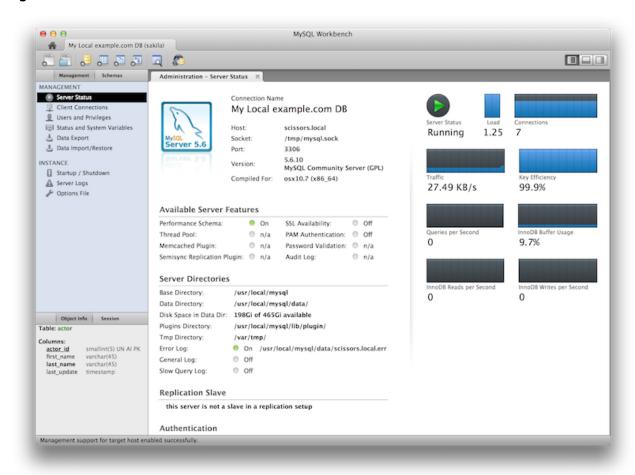

Figure 1.46 Server Status: Workbench 6.0

### **Enterprise Features**

Support for MySQL Enterprise features in the Commercial Edition of MySQL Workbench was added. From within the **Management** tab for an open connection, look for the following products under the heading **MySQL Enterprise**:

MySQL Enterprise Backup (MEB): A GUI front end for the MEB tool. After installing a Commercial Edition of MySQL Workbench and MySQL Enterprise Backup, MySQL Workbench will check for and handle the prerequisites. Backup recovery is also supported. This plugin supports MEB with local and remote installations of Linux and macOS, and locally for MySQL Windows.

MySQL Audit Log Inspector: A GUI for browsing the contents of generated logs by the commercial Audit Log Plugin. Powerful filtering and search capabilities are available. Fast browsing is provided by caching the log data locally in an encrypted file. This plugin supports MEB with local and remote installations of Linux and macOS, and locally for Microsoft Windows.

### **Database Migration Features**

SQL Anywhere and SQLite are now supported.

## 1.2 MySQL Workbench Editions

MySQL Workbench is available in the following editions:

- Community Edition (Open Source, GPL) -- This is the foundation for all other editions
- Standard Edition (Commercial)
- Enterprise Edition (Commercial)

For details about each edition, see http://www.mysql.com/products/workbench/features.html

For more information about the Enterprise edition, visit http://www.mysql.com/enterprise

MySQL Workbench is available for Windows, Linux, and macOS.

Binary distributions of MySQL Workbench are available for the preceding platforms. Source code distributions are also available as a tar.gz package, or an RPM package.

MySQL Workbench downloads are available at http://dev.mysql.com/downloads/workbench/. The source code is also available on GitHub.

The following sections explain the installation process for each of these platforms.

## 2.1 System Requirements

MySQL Workbench is available on a number of operating systems and platforms. For information about those platforms that are officially supported, see <a href="http://www.mysql.com/support/supportedplatforms/workbench.html">http://www.mysql.com/support/supportedplatforms/workbench.html</a> on the MySQL website.

## **General Requirements**

General requirements and considerations that apply to all operating systems.

 MySQL server: Although it is not required, MySQL Workbench is designed to have either a remote or local MySQL server connection. For additional information about connecting to a MySQL server, see Chapter 5, Connections in MySQL Workbench. For additional information about installing a MySQL server, see Installing and Upgrading MySQL.

Data modeling does not require a MySQL server connection.

Some features take advantage of MySQL server features, and as such, they require more recent versions of MySQL Server. For example, the **Performance Dashboard** requires MySQL Server 5.6 or higher.

• Simultaneous client connections: Opening a MySQL connection from the MySQL Workbench home page opens a new connection tab in MySQL Workbench for that connection. Each of these tabs

requires two MySQL connections to perform basic tasks, such schema discovery and SQL execution. Additionally, performing management related tasks, such as **Server Status**, requires two additional MySQL connections. Essentially, this means that each MySQL connection tab in MySQL Workbench requires four available connections to MySQL. For additional information about "Too many connection" related errors, see Too many connections.

This connection requirement doubles with each connection tab opened in MySQL Workbench, even if the two connection tabs point to the same MySQL server. SQL editor tabs share their connections, so having multiple SQL editor and SQL results tabs does not affect the number of required connections.

#### Note

On startup, the application checks the OpenGL version and chooses between software and hardware rendering. To determine which rendering method is being used, open the **Help** menu and choose the **System Info** item.

## **Requirements for Linux**

- The requirements for Linux are embedded within their respective packages. Use the platform specific tool (for example, yum or apt) to install the package and their dependencies.
- The "Save password in keychain" functionality requires gnome-keyring to store the passwords. Note that on KDE systems, the gnome-keyring daemon is not started by default.
- For Linux and macOS, the MySQL server administration features require sudo privileges to execute several commands. The sudo user must be capable of executing the following system commands:

```
/usr/bin/sudo
/usr/bin/nohup
/usr/bin/uptime
/usr/bin/which
/usr/bin/stat

/bin/bash
/bin/mkdir
/bin/rm
/bin/rmdir
/bin/rdd
/bin/cp
/bin/ls
```

Additionally, the sudo user must keep the HOME environment variable when executing system commands, which means adding the following to /etc/sudoers:

```
env_keep +="HOME"
```

For MySQL Workbench to execute MySQL Enterprise Backup commands, the sudo user must also be able to execute the MySQL Enterprise Backup binary.

## **Requirements for Windows**

- Microsoft .NET Framework 4.5
- Microsoft Visual C++ 2015 Redistributable Package

#### Note

The 2013 version was changed to 2015 with MySQL Workbench 6.3.9.

· Windows 7 and above

#### Note

MySQL Workbench 6.1 supports earlier versions of Windows, including Vista.

## 2.2 Command-Line Options

In addition to platform-specific command-line options, MySQL Workbench has the following command-line options:

#### **Note**

On Microsoft Windows, the command-line options contain one leading dash instead of two. For example, use <code>-log-level</code> for Microsoft Windows and <code>--log-level</code> for Linux and macOS.

--log-level level: Controls the verbosity level for logging output from Workbench.

With increasingly levels of verbosity, the valid values for level are: error, warning, info, debug1, debug2, and debug3.

The location of the generated log files, such as wb.log, are as follows:

Table 2.1 Default location of generated MySQL Workbench log files

Platform	Default location
Linux	~/.mysql/workbench/log/
macOS	~/Library/Application Support/Workbench/log/
Microsoft Windows	<pre>C:\Users\user_nameAppData\Roaming\MySQL\Workbench\log\</pre>

- --admin instance: Open an administration tab to the named MySQL instance.
- --upgrade-mysql-dbs: Open the Migration Wizard tab.
- --migration: Open the Migration Wizard tab.
- --log-to-stderr: Also log to stderr.
- --version: Show MySQL Workbench version number and exit.
- --verbose, -v: Enable diagnostics output.
- --query [connection|connection\_string]:
  - Empty: Open a query tab and prompts for a connection.
  - Connection: Open a named connection.
  - Connection\_string: Create a connection based on the entered connection string, which should be in the form \$USER@\$HOST:\$PORT.

- --model modelfile: open the given EER model file.
- --script script: Open the given SQL file in a connection, typically used with the --query parameter.
- --run code: Execute the given code using the default language for GRT shell.
- --run-python *script*: Execute the given code in Python.
- --run-script file: Execute Python code from a file.
- --open file: Open the given file at startup. Deprecated, so instead use specific types such as --script or --model.
- --quit-when-done: Quits MySQL Workbench after --script or --run finishes.

## 2.3 MySQL Workbench on Windows

## 2.3.1 Installing

MySQL Workbench for Windows can be installed using the MySQL Installer that installs and updates all MySQL products on Windows or the standalone Windows MSI Installer package.

#### **Important**

Installing MySQL Workbench using a Windows MSI Installer package requires either Administrator or Power User privileges.

### **Requirements for Windows**

- Microsoft .NET Framework 4.5
- Microsoft Visual C++ 2015 Redistributable Package

#### Note

The 2013 version was changed to 2015 with MySQL Workbench 6.3.9.

· Windows 7 and above

#### Note

MySQL Workbench 6.1 supports earlier versions of Windows, including Vista.

### Installation Using MySQL Installer

The general MySQL Installer download is available at http://dev.mysql.com/downloads/windows/installer/. The MySQL Installer application can install, upgrade, and manage most MySQL products, including MySQL Workbench.

### This is the Recommended Approach

Managing all of your MySQL products, including Workbench, with MySQL Installer is the recommended approach. It handles all requirements and prerequisites, configurations, and upgrades.

When executing MySQL Installer, you may choose MySQL Workbench as one of the products to install. It is selected by default, and essentially executes the standalone Installer Package described below.

## Installation Using the Windows MSI Installer Package

The standalone download is available at http://dev.mysql.com/downloads/workbench/.

MySQL Workbench can be installed using the Windows MSI Installer package. The MSI package bears the name mysql-workbench-community-version-winarch.msi, where version indicates the MySQL Workbench version number, and arch the build architecture (winx64).

#### Note

The following procedure requires either Administrator or Power User privileges.

- 1. To install MySQL Workbench, right-click the MSI file and select the **Install** item from the pop-up menu, or double-click the file.
- 2. In the **Setup Type** window you may choose a Complete or Custom installation. To use all features of MySQL Workbench choose the Complete option.
- 3. Unless you choose otherwise, MySQL Workbench is installed in C:\%PROGRAMFILES%\MySQL \MySQL Workbench 6.3 edition\_type\, where %PROGRAMFILES% is the default directory for programs for your locale. The %PROGRAMFILES% directory is defined as C:\Program Files\ on most systems.

## 2.3.2 Launching

To start MySQL Workbench on Windows, select **Start**, **Programs**, **MySQL**, then select MySQL Workbench. This executes the MySQLWorkbench.exe file on your system.

Alternatively, start MySQL Workbench from the command line. To view the available command-line options, issue the command MySQLWorkbench -help from the MySQL Workbench installation directory. You will see the following output:

```
MySQLWorkbench.exe [<options>] [<name of a model file or sql script>]
Options:
 -swrendering
                        Force the diagram canvas to use software rendering instead of OpenGL
 -query [<connection>|<connection string>]
                        Open a query tab and ask for connection if nothing is specified.
                        If named connection is specified it will be opened, else connection
                        will be created based on the given connection string, which should
                        be in form <user>@<host>:<port>
                       Open a administration tab to the named instance
 -admin <instance>
 -upgrade-mysql-dbs
                       Open a migration wizard tab
 -model <model file> Open the given EER model file
 -script <sql file>
                       Open the given SQL file in an connection, best in conjunction with
                        a query parameter
 -run-script <file>
                       Execute Python code from a file
                      Execute the given Python code
 -run <code>
 -run-python <code> Execute the given Python code
 -migration
                      Open the Migration Wizard tab
 -quit-when-done
-log-to-stderr
                       Quit Workbench when the script is done
                       Also log to stderr
 -help, -h
                       Show command line options and exit
 -log-level=<level> Valid levels are: error, warning, info, debug1, debug2, debug3
 -verbose, -v
                       Enable diagnostics output
```

```
-version Show Workbench version number and exit
-open <file> Open the given file at startup (deprecated, use script, model etc.)
```

Use the <u>-swrendering</u> option if your video card does not support OpenGL 1.5. The <u>-version</u> option can be used to display the MySQL Workbench version number. The other options are self-explanatory.

MySQL Workbench may also be started from MySQL Notifier by choosing **SQL Editor** or **Configure Instance** from the Notifier context menu. For additional information, see MySQL Notifier.

## 2.3.3 Uninstalling

The method for uninstalling MySQL Workbench depends on how you installed MySQL Workbench.

### Removing MySQL Workbench After Installation Using the Installer Package

 To uninstall MySQL Workbench, open the Control Panel and Choose Add or Remove Programs.
 Find the MySQL Workbench entry and choose the Remove button. This will remove MySQL
 Workbench.

#### Note

If you installed MySQL Workbench using the Installer package, it is not possible to remove MySQL Workbench from the command line. Although you can manually remove some of the components, there is no command-line option for removing MySQL Workbench.

Removing the MySQL Workbench directory manually will not remove all the files belonging to MySQL Workbench.

#### Removing MySQL Workbench After Installation from the MySQL Installer

Open the MySQL Installer for Windows, click **Remove MySQL Products**, choose MySQL Workbench, and then **Execute**.

#### What Is Not Removed

Uninstalling MySQL Workbench does not remove your Workbench configuration directory. This directory includes your MySQL connections, configuration settings, cache files, SQL snippets and history, logs, custom modules, and more. These files are stored under your user's <code>%AppData%</code> directory.

#### Note

By default, the Workbench configuration directory is C:\username\AppData \Roaming\MySQL\Workbench\ where "C:\username\AppData\Roaming\" is the value of your  $\alpha \$  Windows system variable.

Also, uninstalling Workbench does not remove the .mysqlworkbench schema that Workbench creates when sharing SQL snippets across a MySQL connection. For additional information about shared snippets, see Section 8.1.5, "SQL Snippets Tab".

## 2.4 MySQL Workbench on Linux

## 2.4.1 Installing

There are binary distributions of MySQL Workbench available for several variants of Linux, including Fedora, Oracle Linux, and Ubuntu.

Installation options include:

- Official MySQL Yum or APT repository packages: These binaries are built by the MySQL Release team. For additional information about installing these, see Yum or APT. They contain the newest versions of MySQL Workbench. Typically this package is named mysql-workbench-community.
- Your Linux distributions repository packages: These binaries are built and maintained by members of the Linux distribution you use, and not by the MySQL team. They are stable but the releases often lag behind. Typically this package is named mysql-workbench.
- Download official MySQL packages: Downloads are available at http://dev.mysql.com/downloads/workbench.
- **Download the source code and compile yourself**: The source code is available at http://dev.mysql.com/downloads/workbench as a tar.gz or RPM package.

#### Note

32-bit binary builds are not available as of MySQL Workbench 6.2.0. You can use the source code to build your own 32-bit version, as needed.

The procedure for installing on Linux depends on which Linux distribution you are using.

### **Requirements for Linux**

- The requirements for Linux are embedded within their respective packages. Use the platform specific
  tool (for example, yum or apt) to install the package and their dependencies.
- The "Save password in keychain" functionality requires gnome-keyring to store the passwords. Note that on KDE systems, the gnome-keyring daemon is not started by default.
- For Linux and macOS, the MySQL server administration features require sudo privileges to execute several commands. The sudo user must be capable of executing the following system commands:

```
/usr/bin/sudo
/usr/bin/nohup
/usr/bin/uptime
/usr/bin/which
/usr/bin/stat

/bin/bash
/bin/mkdir
/bin/rm
/bin/rmdir
/bin/rdd
/bin/cp
/bin/ls
```

Additionally, the sudo user must keep the HOME environment variable when executing system commands, which means adding the following to /etc/sudoers:

```
env_keep +="HOME"
```

For MySQL Workbench to execute MySQL Enterprise Backup commands, the sudo user must also be able to execute the MySQL Enterprise Backup binary.

### Installing DEB packages

On Ubuntu, and other systems that use the Debian package scheme, you can either download and install .deb packages or use the APT package manager.

### **Using the APT Package Manager**

#### **Important**

Your Linux distribution includes MySQL Workbench builds where "apt-get install mysql-workbench" will install their build of the MySQL Workbench package. To use the official MySQL Workbench builds as provided by the MySQL Release team, you must install the official MySQL APT repository and choose the "mysql-workbench-community" package instead of "mysql-workbench".

• First, install the MySQL APT repository as described in the MySQL APT Repository documentation. For example:

```
shell> sudo dpkg -i mysql-apt-config_0.5.3-1_all.deb shell> sudo apt-get update
```

 Next, install MySQL Workbench. You might have multiple Workbench packages available, so choose the "mysql-workbench-community" version. For example:

```
shell> sudo apt-get install mysql-workbench-community
```

#### Manually Installing a Package

You install MySQL Workbench using a command such as:

```
shell> sudo dpkg -i package.deb
```

package.deb is the MySQL Workbench package name; for example, mysql-workbench-community-version1ubu1404-amd64.deb, where version is the MySQL Workbench version number.

#### Note

You may be warned that certain libraries are not available, depending on what you already have installed. Install the required libraries and then install the MySQL Workbench package again.

### Installing RPM packages

On Red Hat-based systems, and other systems that use the RPM package format, you can either download and install RPM packages or use the Yum package manager.

#### Note

Enterprise Linux systems, such as Oracle Linux and Red Hat, require access to the EPEL package repository. For additional information about installing EPEL, see Installing Oracle Enterprise Linux and similar.

#### **Using the Yum Package Manager**

Your Linux distribution includes MySQL Workbench builds where "yum install mysql-workbench" will install their build of the MySQL Workbench package. To use the official MySQL Workbench builds as provided by the MySQL Release team, you must install the official MySQL Yum repository and choose the "mysql-workbench-community" package instead of "mysql-workbench".

 First, install the MySQL Yum repository as described in the MySQL Yum Repository documentation. For example:

```
shell> sudo rpm -Uvh mysql-community-release-el7-7.noarch.rpm
```

• Next, install MySQL Workbench. You might have multiple Workbench packages available, so choose the "mysql-workbench-community" version. For example:

```
shell> sudo yum install mysql-workbench-community
```

### Manually Installing a Package

```
shell> sudo rpm -i package.rpm
```

package.rpm is the MySQL Workbench package name; for example, mysql-workbench-community-version-1fc10.x86\_64.rpm, where version is the MySQL Workbench version number.

### Installing Oracle Enterprise Linux and similar

MySQL Workbench requires access to the EPEL repository. EPEL is a repository with additional RPM packages that are not part of the core RHEL/OEL distribution. This includes packages (such as tinyxml) that MySQL Workbench requires.

You need to set up the EPEL repository in yum to resolve the required dependencies. For example, using Oracle Linux 6.8 you would:

```
shell> wget http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm
shell> rpm -ivh epel-release-6-8.noarch.rpm

shell> yum repolist

Loaded plugins: refresh-packagekit, rhnplugin
repo id repo name status
epel Extra Packages for Enterprise Linux 6 - x86_64 7,124
```

These instructions also apply to similar Linux distributions such as Red Hat Enterprise Linux, CentOS, and Scientific Linux.

Next, follow the RPM-based installation documentation at Installing RPM packages.

## 2.4.2 Launching

After MySQL Workbench has been installed, it can be launched by selecting **Applications**, **Programming**, **MySQL Workbench** from the main menu.

MySQL Workbench can also be launched from the command line on Linux. Type the command:

```
shell> /usr/bin/mysql-workbench --help
```

This will display the available command-line options:

```
mysql-workbench [<options>] [<name of a model file or sql script>]
Options:
                                    Force Xlib rendering
   --force-sw-render
   --force-opengl-render Force OpenGL rendering
  --query [<connection>|<connection string>]
                                    Open a query tab and ask for connection if nothing is specified.
                                    If named connection is specified it will be opened, else connection
                                    will be created based on the given connection string, which should
                                    be in form <user>@<host>:<port>
  --admin <instance>
                                   Open a administration tab to the named instance
  --upgrade-mysql-dbs Open a migration wizard tab

--model <model file> Open the given EER model file
   --script <sql file>
                                    Open the given SQL file in an connection, best in conjunction with
                                    a query parameter
  --run-script <file> Execute Python code from a file
--run <code> Execute the given Python code
--run-python <code> Execute the given Python code
  --migration Open the Migration Wizard tab
--quit-when-done Quit Workbench when the script is done
--log-to-stderr Also log to stderr
--help, -h Show command line options and exit
--log-level=<level> Valid levels are: error, warning, info, debug1, debug2, debug3
--verbose, -v Enable diagnostics output
--version Show Workbench version number and
                                    Show Workbench version number and exit
   --open <file>
                                    Open the given file at startup (deprecated, use script, model etc.)
```

## 2.4.3 Uninstalling

The procedure for uninstalling MySQL Workbench on Linux depends on the package you are using.

#### Note

When using apt, the official package name at dev.mysql.com is mysql-workbench-community, whereas most Linux distributions use the name mysql-workbench. Adjust the following commands accordingly.

### **Uninstalling DEB packages**

To uninstall a Debian package, use the following:

```
shell> sudo apt-get remove mysql-workbench-community
```

Or, alternatively:

```
shell> sudo dpkg -r mysql-workbench-community
```

This command does not remove the configuration files. If you wish to also remove the configuration files, use this command:

```
shell> sudo dpkg --purge mysql-workbench-community
```

#### Uninstalling RPM packages

#### Note

When using yum, the official package name at dev.mysql.com is mysql-workbench-community, whereas most Linux distributions use the name mysql-workbench. Adjust the following commands accordingly.

To uninstall an RPM package, use this command:

```
shell> sudo yum remove mysql-workbench-community
```

Or, alternatively:

```
shell> sudo rpm -e mysql-workbench-community
```

This command does not remove the configuration files.

### What Is Not Removed

By default, uninstalling MySQL Workbench does not remove your Workbench configuration directory. This directory includes your MySQL connections, configuration settings, cache files, SQL snippets and history, logs, custom modules, and more. These files are stored under your user's .mysql/workbench/directory.

#### Note

By default, the Workbench configuration directory is ~username/mysql/workbench/ where "~username" is the path to your user's home directory.

Also, uninstalling Workbench does not remove the .mysqlworkbench schema that Workbench creates when sharing SQL snippets across a MySQL connection. For additional information about shared snippets, see Section 8.1.5, "SQL Snippets Tab".

## 2.5 MySQL Workbench on macOS

## 2.5.1 Installing

MySQL Workbench for macOS is distributed as a DMG file. The file is named mysql-workbench-community-version-osx.dmg, where version is the MySQL Workbench version.

Downloads are available at http://dev.mysql.com/downloads/workbench/.

To install MySQL Workbench on macOS, download the file. Double-click the downloaded file. You will be presented with the installation window shown in the figure that follows.

Figure 2.1 MySQL Workbench macOS Installation Window

Drag the MySQL Workbench icon onto the Applications icon as instructed. MySQL Workbench is now installed.

You can now launch MySQL Workbench from the Applications folder, or from the command line:

```
shell> /Applications/MySQLWorkbench.app/Contents/MacOS/MySQLWorkbench --help
```

This will display the available command-line options:

```
MySQLWorkbench [<options>] [<name of a model file or sql script>]
Options:
  --query [<connection>|<connection string>]
                            Open a query tab and ask for connection if nothing is specified.
                            If named connection is specified it will be opened,
                            else connection will be created based on the given connection string,
                        Open a administration tab to the named instance
                            which should be in form <user>@<host>:<port>
  --admin <instance>
  --upgrade-mysql-dbs
                           Open a migration wizard tab
  --model <model file>
                           Open the given EER model file
                        Open the given SQL file in an connection, best in conjunction
  --script <sql file>
                           with a query parameter
  --run-script <file> Execute Python code from a file
--run <code> Execute the given Python code
  --run <code>
--run-python <code>
--migration
Open the Migration Wizard tab
Quit Workbench when the script is done
  --help, -h
                           Show command line options and exit
  --heip, -n
--log-level=<level>
                           Valid levels are: error, warning, info, debug1, debug2, debug3
  --verbose, -v
                           Enable diagnostics output
  --version
                           Show Workbench version number and exit
  --open <file>
                            Open the given file at startup (deprecated, use script, model etc.)
```

## 2.5.2 Launching

To launch MySQL Workbench on macOS, open the Applications folder in the Finder, then double-click MySQL Workbench.

It is also possible to start MySQL Workbench from the command line:

```
shell> open MySQLWorkbench.app [options] [model_file]
```

Specifying options and/or a model file is optional.

## 2.5.3 Uninstalling

To uninstall MySQL Workbench for macOS, locate MySQL Workbench in the Applications folder, rightclick, and select **Move to Trash**.

### What Is Not Removed

By default, uninstalling MySQL Workbench does not remove your Workbench configuration directory. This directory includes your MySQL connections, configuration settings, cache files, SQL snippets and history, logs, custom modules, and more. These files are stored under your user's MySQL/Workbench/ folder.

#### **Note**

By default, the Workbench configuration directory is ~username/Library/Application Support/MySQL/Workbench where "~username" is the path to your user's home directory.

Also, uninstalling Workbench does not remove the .mysqlworkbench schema that Workbench creates when sharing SQL snippets across a MySQL connection. For additional information about shared snippets, see Section 8.1.5, "SQL Snippets Tab".

MySQL Workbench includes methods to improve user accessibility.

## **Fonts**

Under Preferences, modeling fonts are adjustable from the Appearance section of the Modeling menu:

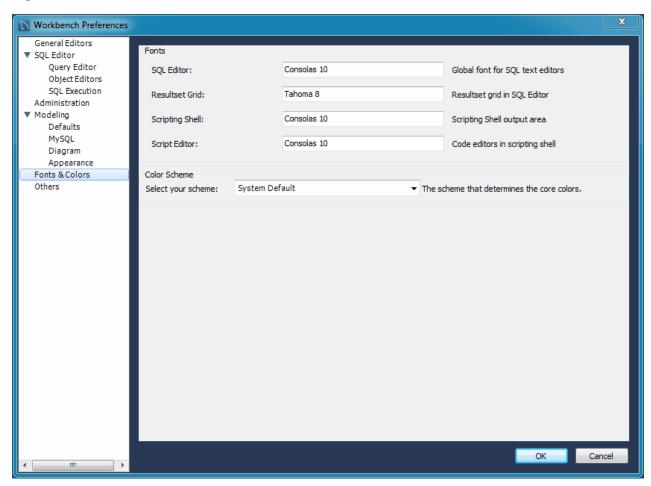

**Figure 3.1 Appearance Preferences** 

Choose the character set under the **Configure Fonts For** setting (typically leave the default setting here) and then adjust the model fonts to fit your needs.

The font types and sizes for other GUI elements are set under the Fonts & Colors tab:

#### Note

Font changes require a refresh or restart before they take effect.

The following figure shows the SQL Editor after changing the **Editor** font size from 10 to 30:

## **Color Presets**

Here you define the colors used in EER diagrams for the tables, views, layers, and notes. You can edit or add additional color choices by entering their ASCII values.

# **Theming**

On Windows, the **Fonts & Colors** preference tab also includes a "Color Scheme" configuration section. From here, you can enable the **High Contrast** color theme. This theme preference affects the MySQL Workbench GUI.

## **Microsoft Active Accessibility (MSAA)**

On Windows, MySQL Workbench supports MSAA, which enables the use of screen reader applications with MySQL Workbench.

## 3.2 Workbench Preferences

Use the **Preferences** menu to configure MySQL Workbench to your specific needs. This menu is divided sections, as described below:

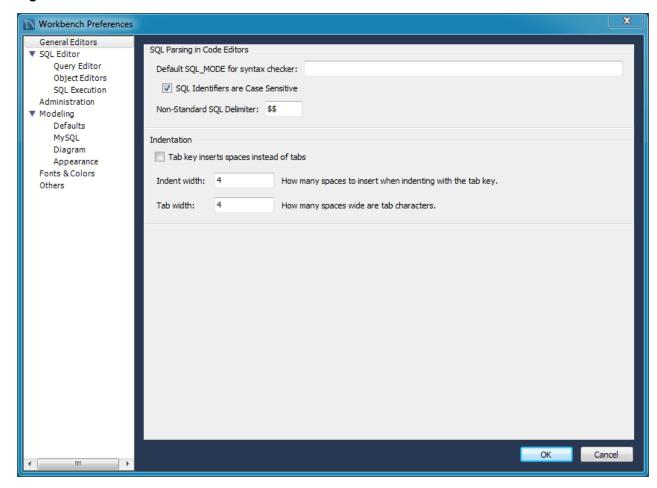

- General Editors: General-purpose editor options, such as SQL parsing options.
- SQL Editor: SQL editor related preferences that also includes subsections for the Query Editor, Object Editor, and SQL Execution.
- Administration: Tools used by the Administrator functionality.
- Modeling: Model related preferences that also includes subsections for Defaults, MySQL (MySQL specific settings), Diagram (EER), and Appearance (model colors and fonts).
- Fonts & Colors: Change fonts for tools such as the SQL editor and results grid.
- Others: Miscellaneous options.

A more detailed discussion of these options follows.

## 3.2.1 General Editors Preferences

This section describes the preference options that apply to general-purpose editors (see the figure that follows).

Figure 3.5 Preferences: General Editors

#### **SQL Parsing in Code Editors**

SQL properties that can be set include the  $SQL\_MODE$ , case sensitivity of identifiers, and the SQL delimiter used.

• **Default SQL\_MODE for syntax checker**: Optionally configure the SQL\_MODE for the SQL editor's SQL syntax checker.

The document property SqlMode defines SQL\_MODE for all operations affecting SQL parsing at the document scope. The purpose of this option is to preserve the consistency of SQL statements within the document.

The property has the following functions:

• Sets the SQL\_MODE DBMS session variable to the value stored in the SqlMode property of the document when performing reverse engineering, forward engineering, or synchronization operations.

• Honors the SQL\_MODE values defined in SqlMode so that SQL parsing is correct.

Only a subset of all possible SQL\_MODE values affect the MySQL Workbench SQL parser. These values are: ANSI\_QUOTES, HIGH\_NOT\_PRECEDENCE, IGNORE\_SPACE, NO\_BACKSLASH\_ESCAPES, PIPES\_AS\_CONCAT. Other values do not affect the MySQL Workbench SQL parser and are ignored.

If the value of SqlMode is not set, the default value of the SQL\_MODE session variable defined by the server stays unchanged during operations with the server. However, the MySQL Workbench SQL parser behaves as if SQL\_MODE is also not set. This may potentially lead to inconsistencies in parsing of SQL statements stored in the document. If you choose to not set the SqlMode property, ensure that the default SQL\_MODE variable defined by the server does not contain any values from the following list: ANSI\_QUOTES, HIGH\_NOT\_PRECEDENCE, IGNORE\_SPACE, NO\_BACKSLASH\_ESCAPES, PIPES\_AS\_CONCAT.

The SqlMode property is defined in two locations: globally and at document scope. MySQL Workbench uses the global property to initialize the document property for each new document created. For each document, the property value defined at document scope always has higher priority over the one defined globally.

- [] **SQL Identifiers are Case Sensitive**: Whether to treat identifiers separately if their names differ only in letter case. This is enabled by default.
- Non-Standard SQL Delimiter: [\$\$]. Define the SQL statement delimiter to be different from the normally used delimiter (such as ";"). Change this if the deliminator you normally use, specifically in stored routines, happens to be the current setting.

#### Indentation

#### Note

This preference section was added in MySQL Workbench 6.2.4.

- [] Tab key inserts spaces instead of tabs
- Indent width: [4] The number of spaces inserted after pressing **Tab** -- this assumes that the *Tab key inserts spaces instead of tabs* option is enabled
- Tab width: [4] The width (number of spaces) that tab characters are displayed as in MySQL Workbench

### 3.2.2 SQL Editor Preferences

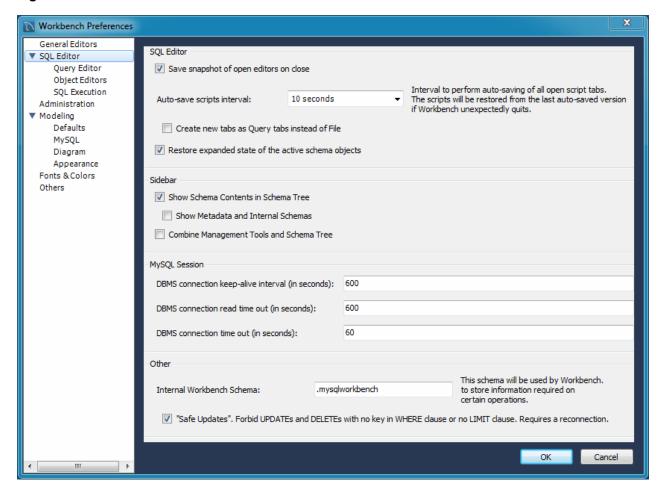

This section provides configuration options that affect the SQL Editor functionality in MySQL Workbench.

As the following figure shows, the SQL Editor preferences has three additional sections: Query Editor, Object Editors, and SQL Execution.

Preferences: SQL Editor: Main

**SQL** Editor

Figure 3.6 Preferences: Main SQL Editor Section

- Save snapshot of open editors on close: Enabling will save and reload the SQL Editor tabs after closing/opening MySQL Workbench (including after an unexpected crash).
- · Auto-save scripts interval: Frequency of the auto-saves.
- Create new tabs as Query tabs instead of File: By default, opening a new SQL Editor tab opens as an SQL File tab. Check this option if you prefer the simpler Query tabs that, for example, will not prompt to be saved when closed.
- Restore expanded state of the active schema objects: Group nodes that were previously expanded in the active schema when the SQL editor was last closed are re-expanded and loaded. This is enabled by default.

#### Sidebar

- Show Schema Contents in Schema Tree: Enumerating, populating, and drawing large numbers of items can significantly increase loading times. For this reason, this facility can be switched off for models containing large numbers of schemata and tables.
- Show Data Dictionaries and Internal Schemas: Whether to show data directories and internal schemas in the schema tree (such as INFORMATION\_SCHEMA, mysql, and schemas starting with ".").

• Combine Management Tools and Schema Tree tab: This affects the Object Browser in the left sidebar, and this option can also be toggled from the sidebar. The management tools and schema tree can be viewable as separate tabs, or as a single long list.

#### MySQL Session

- **DBMS connection keep-alive interval (in seconds)**: [600]. Time interval between sending keep-alive messages to the DBMS. Set to 0 to not send keep-alive messages.
- **DBMS connection read time out (in seconds)**: [600]. The maximum amount of time the query can take to return data from the DBMS. Set 0 to not check the read time out.
- **DBMS connection time out (in seconds)**: [60]. Maximum time to wait before a connection attempt is aborted.

#### Other

- Internal Workbench Schema: [.mysqlworkbench]. This schema is used by MySQL Workbench to store information required for certain operations, such as saving shared SQL snippets.
- []: "Safe Updates", forbid UPDATE and DELETE queries to execute that lack a corresponding key in a WHERE clause, or lack a LIMIT clause. Setting this option requires a MySQL server reconnection.

This makes it possible to catch UPDATE and DELETE statements where keys are not used properly and that would probably accidentally change or delete a large number of rows.

## **Preferences: SQL Editor: Query Editor**

The following figure shows the preference options that apply to the Query Editor.

Workbench Preferences General Editors Productivity ▼ SQL Editor Query Editor Enable Code Completion in Editors Object Editors Automatically Start Code Completion SQL Execution Administration Use UPPERCASE keywords on completion ▼ Modeling Defaults Comment type to use for comment shortcut: --MySQL Max syntax error count: 100 Diagram Appearance Max number of result sets: 50 Fonts & Colors Others SOL Beautifier Change keywords to UPPER CASE Cancel

Figure 3.7 Preferences: SQL Editor: Query Editor

### **Productivity**

- Enable Code Completion in Editors: The SQL Editor offers Auto-complete functionality by either
  pressing the keyboard shortcut (Modifier + Space), or it will start automatically if the Automatically
  Start Code Completion preference is enabled.
- Automatically Start Code Completion: Enabled by default, this will automatically execute the code auto-completion feature while editing SQL in the SQL Editor. If disabled, you will instead use the keyboard shortcut Modifier + Space to execute the auto-completion routine.
- Use UPPERCASE keywords on completion: Normally keywords are shown and inserted as they come
  from the code editor's configuration file. This setting will always write completed keywords as uppercase.
- Comment type to use for comment shortcut: [--]. Defaults to "--", with "#" as another option.
- Max syntax error count: Large complex scripts may contain errors. Further, a syntax error early on can lead to subsequent syntax errors. For these reasons, it is possible to limit the number of errors displayed using this option. The default is 100 error messages.
- Max number of result sets: Maximum number of result sets for SQL queries that can be opened for a single SQL editor. Defaults to 50. Reaching the limit emits a warning.

#### Note

This option was added in MySQL Workbench 6.2.4.

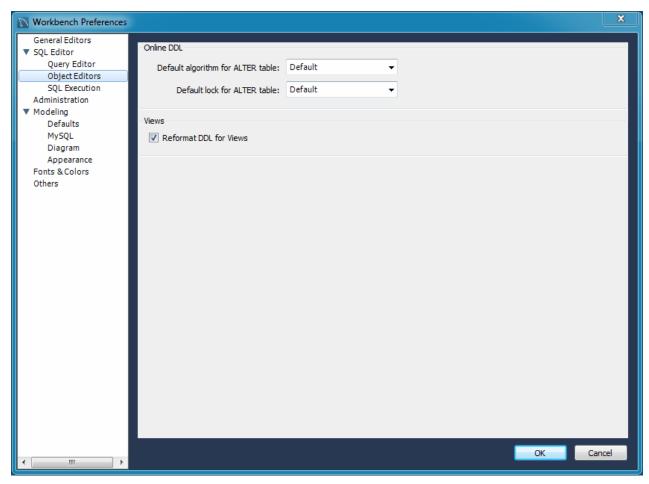

### **SQL** Beautifier

 [] Change keywords to UPPER CASE: Enabled by default, executing the SQL beautifier will uppercase all SQL keywords.

## Preferences: SQL Editor: Object Editors

The following figure shows the preference options that apply to all object editors.

Figure 3.8 Preferences: SQL Editor: Object Editors

### **Online DDL**

- **Default algorithm for ALTER table**: The default algorithm selected when performing ALTER TABLE operations in MySQL Workbench. The setting can also be adjusted for each ALTER TABLE operation. Options include "In-Place" (preferred) and "Copy", see the online DDL documentation for more information.
- **Default lock for ALTER table**: The default lock setting for allowing concurrent queries with ALTER TABLE in MySQL Workbench. This setting can also be adjusted for each ALTER TABLE operation.

Options include "None", "Shared", and "Exclusive", see the online DDL documentation for more information.

#### **Views**

 Reformat DDL for Views: Whether to automatically reformat the View DDL that is returned by the MySQL Server.

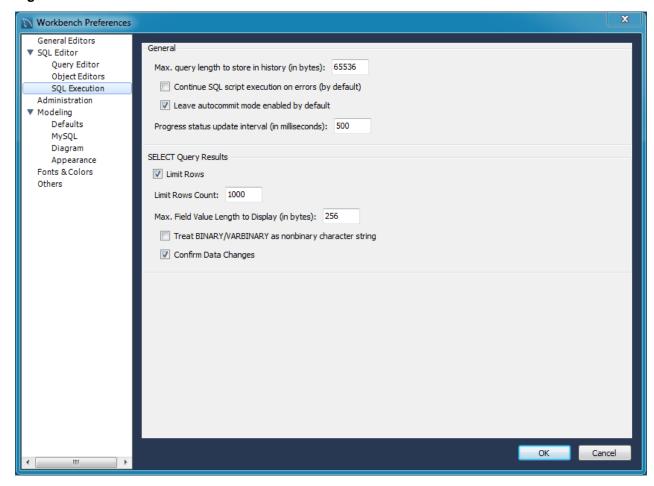

### Note

The MySQL Server does not store the formatting information for View definitions.

## **Preferences: SQL Editor: SQL Execution**

The following figure shows the preference options that apply to SQL execution.

Figure 3.9 Preferences: SQL Editor: SQL Execution

#### General

- Max query length to store in history (in bytes): Queries that exceed this size will not be saved in the history when executed. The default is 65536 bytes, and setting to 0 means there is no limit (all queries will be saved).
- Continue on SQL Script Error: Should an error occur while executing a script, this option causes execution to continue for the remainder of the script.

• Leave autocommit mode enabled by default: Toggles the default autocommit mode for connections. When enabled, each statement will be committed immediately.

#### Note

All query tabs in the same connection share the same transaction. To have independent transactions, you must open a new connection.

• **Progress status update interval**: When executing long running queries over a slow connection, you may need to increase this value to prevent excess load on the connection. Defaults to 500 milliseconds.

### **SELECT Query Results**

- Limit Rows: Queries can sometimes return an excessive number of rows, which can heavily load the connection, and take time to display in MySQL Workbench. To prevent this, you can set a more moderate value here. This limit is defined by the Limit Rows Count option.
- Limit Rows Count: Specify the maximum number of result rows to return. Defaults to 1000.
- Max. Field Value Length to Display: To avoid display problems due to excessive field length, it is possible to set the maximum field length to display (in bytes). Defaults to 256.
- Treat BINARY/VARBINARY as non-binary character string: Binary byte string values are not displayed by default in the results grid, but are instead marked as BLOB values. These can then be viewed or edited with the BLOB editor. Nonbinary character string values are displayed in the results grid, and can be edited in the grid cell or using the BLOB editor.

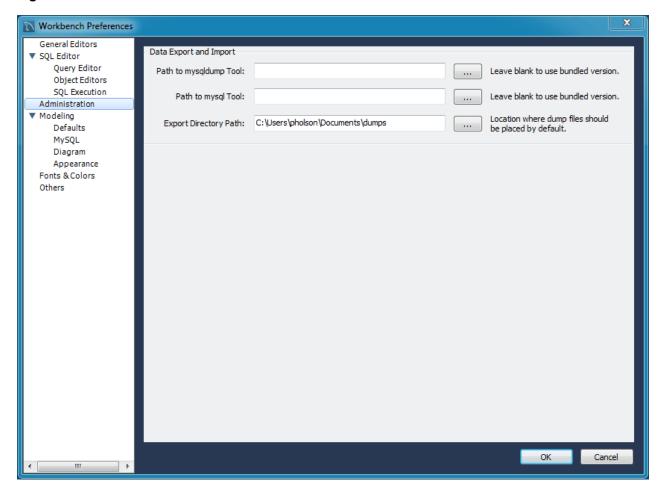

If this option is turned on, data truncation may result: Binary byte string values may contain null bytes as part of their valid data, whereas for nonbinary character strings, a null byte terminates the string.

• Confirm Data Changes: In the SQL Editor, if you edit table data and then click the Applying changes to data button, MySQL Workbench launches a wizard to step you through applying your changes. This gives you a chance to review the SQL that will be applied to the live server to make the requested changes. If this option is deselected, the changes will be applied to the server without the wizard being displayed and without giving you a chance to review the changes that will be made.

## 3.2.3 Administration Preferences

This section provides configuration options that affect the Administration functionality in MySQL Workbench (see the figure that follows).

Figure 3.10 Preferences: Administration

## **Data Export and Import**

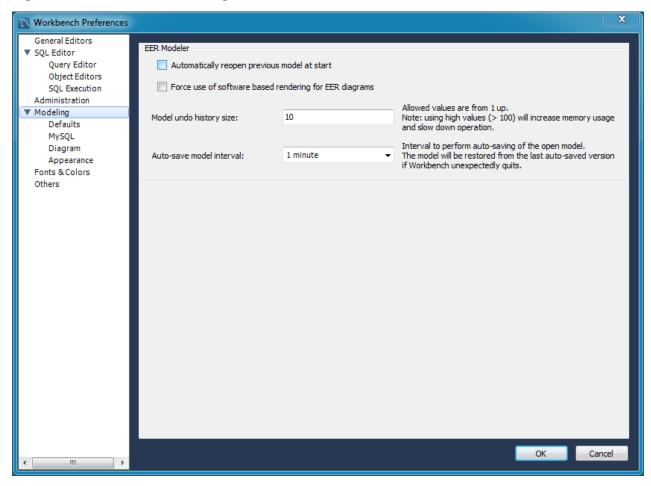

- Path to mysqldump tool: Path to your local mysqldump binary. Leave it blank to use the bundled mysqldump binary.
- Path to mysql tool: Path to your local mysql client binary. Leave it blank to use the bundled mysql binary.
- Export Directory Path: Directory where your exported mysql dumps are located.

# 3.2.4 Modeling Preferences

This section provides configuration options that affect the Modeling functionality in MySQL Workbench (see the figure that follows).

## **Preferences: Modeling: Main**

Figure 3.11 Preferences: Modeling

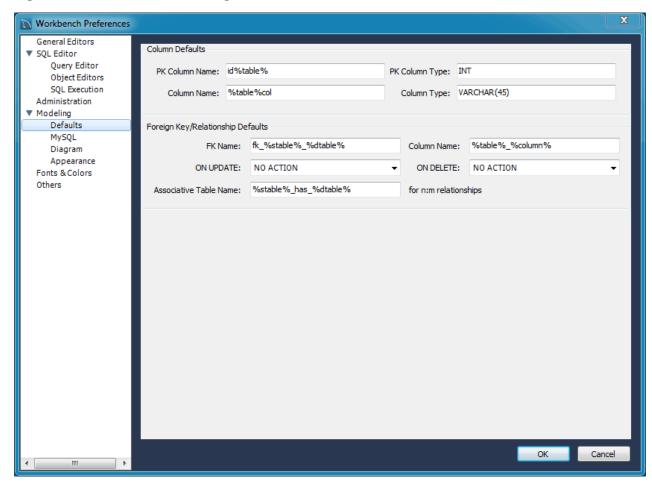

## **EER Modeler**

- Automatically reopen previous model at start: Check this if you want the model on which you previously worked to be automatically reopened when you start MySQL Workbench.
- Force use of software based rendering for EER diagrams: MySQL Workbench will use OpenGL for rendering when available. However, due to faulty drivers, problems do occasionally occur. These issues can be resolved by selecting the software rendering option here.
- **Model undo history size**: You can limit the size of the undo history here. Set this value to 0 to have an unlimited undo history.
- Auto-save model interval: An open model that has not been saved will automatically be saved after
  this period. On loading a model file, MySQL Workbench will notify the user if the file was not previously
  saved correctly, due to a crash or power failure. MySQL Workbench can then attempt to recover the last
  auto-saved version. For automatic recovery to be available for a new file, it will have to have been saved
  at least once by the user.

## **Preferences: Modeling: Defaults**

Sets default values for modeling object names (see the figure that follows).

Figure 3.12 Preferences: Modeling: Defaults

The following tables show the object names and their default values.

### **Column Defaults**

Object Name	Default Value
PK Column Name	id%table%
PK Column Type	INT
Column Name	%table%col
Column Type	VARCHAR (45)

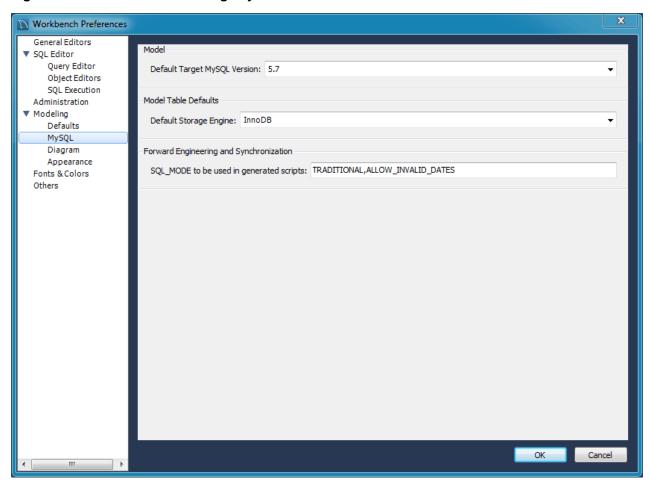

## Foreign Key/Relationship Defaults

Object Name	Default Value
FK Name	fk%stable_%dtable%
Column Name	%table%_%column%
ON UPDATE	NO ACTION
ON DELETE	NO ACTION
Associative Table Name	%stable%_has_%dtable%

## Preferences: Modeling: MySQL

This preference group enables you to set model-related options specific to your MySQL version (see the figure that follows).

Figure 3.13 Preferences: Modeling: MySQL

#### Model

• **Default Target MySQL Version**: A limited subset of validation procedures and table editor options are affected by this MySQL version number.

Supported MySQL Server 5.6 features include fraction seconds support for TIME, DATETIME, and TIMESTAMP, automatic initialization and updates for TIMESTAMP and DATETIME (for example, setting them to CURRENT\_TIMESTAMP), and FULLTEXT index types with the InnoDB engine.

#### **Model Table Defaults**

 Default Storage Engine: Tables created in MySQL Workbench will be defined using this default storage engine.

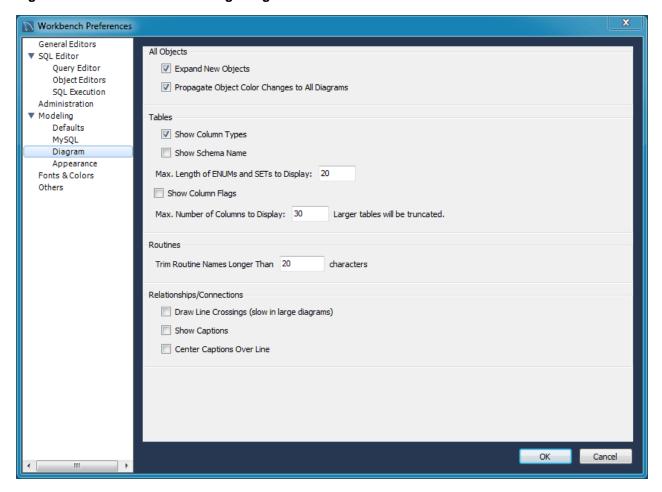

## Forward Engineering and Synchronization

• **SQL\_MODE** to be used in generated scripts: Defaults to "TRADITIONAL,ALLOW\_INVALID\_DATES", this defines the SQL\_MODE used by Forward Engineering and Synchronization.

## **Preferences: Modeling: Diagram**

The following figure shows the preference options that apply to model-related diagrams.

Figure 3.14 Preferences: Modeling: Diagram

### **All Objects**

- [] Expand New Objects: Enabled by default.
- [] Propagate Object Color Changes to All Diagrams: Enabled by default.

#### **Tables**

- [] Show Column Types: Enabled by default.
- [] Show Schema Name:
- Max. Length of ENUMs and SETs to Display: [20]
- [] Show Column Flags:
- Max. Number of Columns to Display: [30] Larger tables will be truncated.

### **Routines**

• Trim Routine Names Longer Than: [20] characters.

## Relationships / Connections

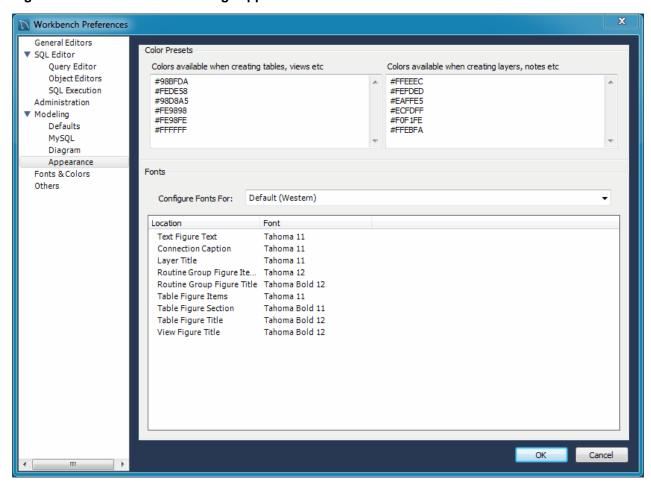

- [] Draw Line Crossings (slow in large diagrams):
- [] Hide Captions: Enabled by default.
- [] Center Captions Over Line:

## **Preferences: Modeling: Appearance**

Use this preference group to set the available colors for the objects that appear on an EER diagram canvas. As the following figure shows, you can also add colors as needed.

For related information, see Section 3.1, "User Accessibility Options".

Figure 3.15 Preferences: Modeling: Appearance

#### **Color Presets**

These are the available colors used while modeling, and they are divided into two sections. First, the colors used when creating tables and views. The second section are available colors for items such as layers and notes.

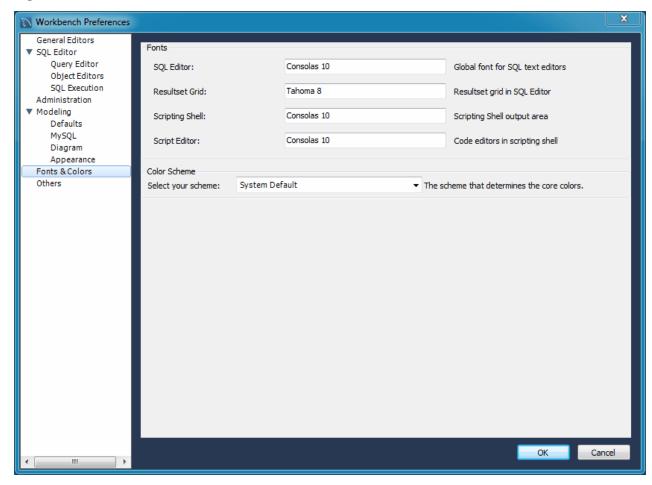

#### **Fonts**

These define the fonts and font sizes used while modeling.

## 3.2.5 Fonts and Colors Preferences

The following figure shows the preference options that apply to fonts and colors.

Figure 3.16 Preferences: Fonts and Colors

#### **Fonts**

- SQL Editor: [Consolas 10] -- Global font for SQL text editors.
- Resultset Grid: [Tahoma 8] -- Resultset grid in SQL editor
- Scripting Shell: [Consolas 10] -- Scripting Shell output area
- Script Editor: [Consolas 10] -- Code editors in scripting shell

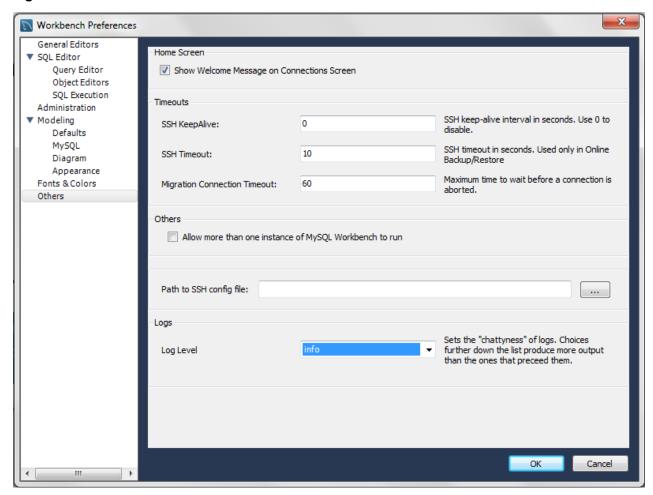

#### **Color Scheme**

On Microsoft Windows, set the scheme that determines the code colors.

## 3.2.6 Other Preferences

The following figure shows the preference options that apply to general items, such as the home screen and logs.

Figure 3.17 Preferences: Others

#### **Home Screen**

• Show Welcome Message on Connections Screen: Enabled by default. This option displays or hides the text and links of the welcome message when MySQL Connections is selected from the side panel and MySQL Workbench is restarted.

#### Note

This option was added in Workbench 6.3.9.

#### **Timeouts**

- SSH KeepAlive: [∅]: This interval (in seconds) without sending any data over the connection, a
   "keepalive" packet will be sent. This option applies to both SSH tunnel connections and remote
   management via SSH.
- **SSH Timeout**: [10]: This interval (in seconds) that online backup/restore will timeout when waiting for a result.

#### Note

This option was added in Workbench 6.3.5.

• Migration Connection Timeout: [60]: Maximum time to wait before a connection is aborted.

### **Others**

 Allow more than one instance of MySQL Workbench to run: By default, only one instance of MySQL Workbench can be running at the same time.

#### Note

All MySQL Workbench instances share the same files and settings, so enable at your own risk.

• Path to SSH config file: Provides a way to specify an alternative path using the browse button.

#### Note

This option was added in Workbench 6.3.9.

#### Logs

• Log Level: Logs at the info level by default. From lowest to highest, the levels are: none, error, warning, info, debug1, debug2, and debug3.

#### Note

This option was added in Workbench 6.3.9.

## 3.3 MySQL Workbench Settings and Log Files

MySQL Workbench saves configuration, cache, and log related files and directories on your system. These files are saved in your user's MySQL Workbench directory as defined by MySQL Workbench, with this base defaulting to:

**Table 3.1 Default Local Configuration Base File Path** 

Operating System	File Path
Windows	%AppData%\MySQL\Workbench\
macOS	~username/Library/Application Support/MySQL/Workbench/
Linux	~username/.mysql/workbench/

A brief description of these directories and files:

**Table 3.2 Local Workbench Files and Directory Descriptions** 

Directory or File	Description
cache/	General behaviors are stored per-connection in *.cache files, and column widths as *.column_widths files
log/	Log files include Workbench startup information, and also per-connection SQL action results performed in Workbench
modules/	Home of installed plugins, for additional information see Section C.3, "Plugins and Tools"
sql_history/	Queries executed in Workbench are stored here, and are available from within MySQL Workbench

Directory or File	Description
snippets/	Saved SQL snippets are stored here, for additional information see Section 8.1.5, "SQL Snippets Tab"
audit_cache/	Cache storage by the Audit Log inspector, for additional information see Section 6.6, "MySQL Audit Inspector Interface"
connections.xml	Saved MySQL server connection information, as seen on the home screen. For information about backing up and restoring this file, see The Tools Menu
server_instances.xm	Stores your MySQL server information, as it relates to your MySQL connections
wb_options.xml	Stores your preferences, both configured and default

## The cache/ Directory

The cache/ directory contains cache files in the user's MySQL Workbench directory. All cache files are stored as SQLite 3 databases, and they are not meant to be edited outside of MySQL Workbench. The types of cache files are:

#### \*.column widths:

These are the saved column widths after adjusting columns in the SQL editor's results grid. The fields include column\_id, stored as column\_name::db\_name::table\_name, and width, stored as an integer of character length.

#### \*.cache:

This information (schemas, engines, and other global information) serves as a quick lookup source for the SQL editor's auto completion functionality, and is implicitly updated whenever the schema tree is updated.

All cache/ file names begin with the MySQL connection name. For example, the column width file is named Local\_instance\_3306.column\_widths for a MySQL connection named "Local Instance 3306".

Cached files remain after a connection is either renamed or deleted.

## The log/ Directory

MySQL Workbench start up and SQL actions are logged and stored in the log/ directory. This directory is in the user's MySQL Workbench directory.

#### Note

To find these text files, from the main Workbench navigation menu choose **Help** and then **Show Log Files**.

#### wb\*.log:

Debugging information is generated when MySQL Workbench is started and unexpectedly stopped. Information includes paths used, modules and plugins loaded, system information, and more. The log files are useful when reporting a MySQL Workbench bug.

The log files rotates when MySQL Workbench is started, in that wb.log is renamed to wb.l.log, wb.log is reset, and the previous wb.l.log file is renamed to wb.l.log, and so on, all the way up to wb.9.log.

### • sql\_actions\_\*.log:

A log of all SQL execution results but without the data, for debugging purposes.

The SQL editor's SQL history does not originate from here, as it is stored in the sql\_history directory.

## The modules/ Directory

Custom plugins (modules) are stored in the modules directory. For additional information about MySQL Workbench plugins, see Section C.3, "Plugins and Tools".

## The sql\_history/ Directory

SQL statements executed in the SQL editor are saved in the sql\_history directory. They are stored as plain text files that are separated one per day (such as 2015-12-15) and they contain your MySQL Workbench SQL statement history for all MySQL connections. For additional information, see Section 8.1.7, "Output History Panel".

## The snippets/ Directory

SQL snippets used by the SQL editor are stored in the snippets directory. These files include bundled snippets (such as "SQL DDL Statements") and custom snippets saved under the **My Snippets** tab. For additional information, see Section 8.1.5, "SQL Snippets Tab".

# 3.4 Tutorial: Add a Custom Link to the Home Page

This tutorial introduces the concept of altering the MySQL Workbench home screen by adding your own shortcut link. Specifically, the tutorial adds a shortcut titled "Example" that opens "example.org" as a browser tab inside MySQL Workbench.

#### Note

Although adding a link to the home screen is not a common need, this tutorial is an example that demonstrates the idea of customizing MySQL Workbench.

First, create an icon for your shortcut. This step is optional, and the table below compares the icon used in this tutorial and the default icon if a custom icon is not defined.

Table 3.3 MySQL Workbench Home Screen Icons

Default Icon	Our Example Icon

Save your new 52x52 pixel image to a location accessible by MySQL Workbench. By default, source icons are stored here:

Table 3.4 Default Path for Home Screen Icons

Operating System	File Path
Windows	"C:\Program Files (x86)\MySQL\MySQL Workbench CE 6.3.10\images\home\

Operating System	File Path
macOS	/Applications/MySQLWorkbench.app/Contents/Resources/
Linux	/usr/share/mysql-workbench/images/

Next, open starters\_settings.xml (this file is located under your user's MySQL Workbench directory) and add an entry for your new shortcut ID where the order determines the location on the home screen. Follow the standard convention by appending your value to "com.mysql.wb.starter.", this tutorial uses "example":

```
<link type="object">com.mysql.wb.starter.example</link>
```

Lastly, open predefined\_starters.xml and add a new "app.Starter" entry.

Table 3.5 Default Path to predefined\_starters.xml

Operating System	File Path
Windows	"C:\Program Files (x86)\MySQL\MySQL Workbench CE 6.3.10\data\
macOS	/Applications/MySQLWorkbench.app/Contents/Resources/data/
Linux	/usr/share/mysql-workbench/data/

This tutorial does not describe this entry in detail, so consider it as a self-explanatory template for now. The important concepts include using the ID you defined in the previous step, your own URL for the "command", and "smalllcon" as a 52x52 pixel image that is displayed on the MySQL Workbench home screen. Adjust these entries according to your needs, including the path to your icon.

#### **Note**

Upgrading MySQL Workbench will overwrite these changes, because predefined\_starters.xml is stored inside the MySQL Workbench installation directory, and starters\_settings.xml is reset during installation. Consider saving copies of these changes for future reference.

Restart MySQL Workbench to see the new link on your MySQL Workbench home screen.

Additional "app.Starter" options include:

```
Require a specific edition of Workbench:

Community:

<value type="string" key="edition">ce</value>

Commercial:
```

# 3.5 Common Preferences and Configurations

Commonly used configuration options and preferences include:

- Rescan for Local MySQL Instances: Right-click on the home screen, and this option will scan your system for MySQL instances and add connection tiles to the home screen.
- Safe Updates: When enabled (default), Workbench will not execute UPDATE or DELETE statements if a key is not defined in the WHERE clause. In other words, Workbench attempts to prevent big mistakes, such as deleting a large number of (or all) rows. Set from the SQL Editor preferences tab.

For example, "DELETE FROM foo" is considered unsafe, whereas "DELETE FROM foo WHERE id = 1" is safe and will always execute.

- Default Target MySQL Version: For modeling, set this Modeling MySQL preference to your target MySQL Server version. This affects the generated syntax and database structure in relation to how MySQL changed over time. Having the wrong version may generate invalid syntax for your MySQL server.
- Combine Management Tools and Schema Tree: This refers to the left panel in the SQL Editor, where the Management and Schemas areas are on one or two separate tabs.

This behavior can also be toggled at runtime by clicking the icon.

Save snapshot of open editors on close: By default, Workbench saves all query tabs and reopens
them when you restart Workbench. Use the related Auto-save scripts interval setting to modify its
behavior. Both are set from the SQL Editor preferences tab.

Related behavior. Right-click on an SQL tab and choose either **Save tab** (to save the tab to a file) or **Close Other Tabs** to close all other SQL editor tabs.

• Enable Code Completion in Editors: Code suggestions can be activated either manually, or automatically if the related Automatically Start Code Completion setting is also enabled. In addition, enable Use UPPERCASE keywords on completion to code suggest upper case SQL keywords, such as "INSERT" instead of "insert".

Related behavior. The **Context Help** right panel in the SQL editor displays documentation for SQL statements, and is disabled/enabled from the right panel. For example, typing INSERT will load documentation for the INSERT statement in the right panel.

# Chapter 4 The Home Screen

This is the first screen you see when opening MySQL Workbench and it is central to starting MySQL Workbench operations. Initially, the screen displays a welcome message and links to **Browse Documentation**, **Read the Blog**, and **Discuss on the Forums**. The home screen provides quick access to MySQL Connections, MySQL Models, and the MySQL Workbench Migration Wizard.

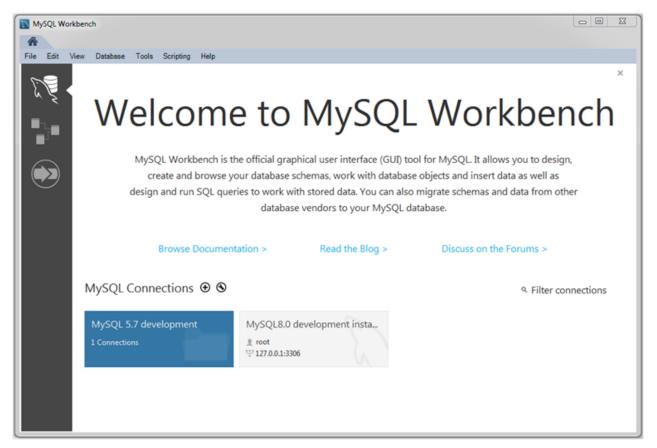

#### Note

In MySQL Workbench 6.3.8 and earlier, the home screen combined three sections titled **MySQL Connections**, **Models**, and external **Shortcuts**.

Most MySQL Workbench functionality, such as the SQL editor and MySQL server manager, begin with opening a MySQL connection from the home screen. As depicted in the following figure, a side panel enables you to toggle between **MySQL Connections** (selected in the figure) and **Models** in the home tab, or to open the MySQL Workbench Migration Wizard in a new tab.

Figure 4.1 The Home Screen

## **MySQL Connections**

This section lists connections to all of your MySQL servers, and allows you to load, configure, group, and view information about each MySQL connection. For more information, see Chapter 5, *Connections in MySQL Workbench* and Section 5.2, "Creating A New MySQL Connection (Tutorial)".

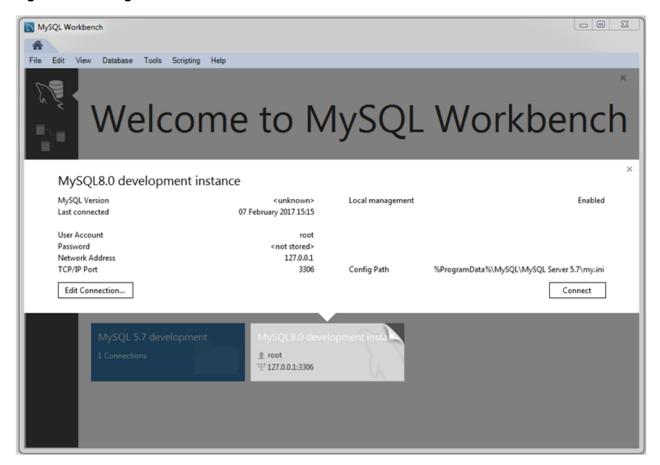

## **Connection Information**

The method to view connection information depends on the operating system.

- On Microsoft Windows and Linux: hover over the right side of a connection title and click the title.
- On macOS: hover over a connection title and click the little (i) in appears in the bottom right corner.

The information will be displayed under the connection tiles, and will appear similar to the following figure.

**Figure 4.2 Viewing Connection Information** 

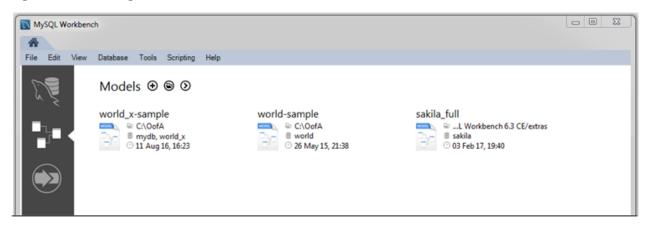

## **Connection Groups**

You may also create groups of connections. Create a group by either right-clicking a connection and choosing the **Move to group** context menu option, or you may prefix your connection name with the group name separated by a forward slash (for example, "QA/TestBox") when you create or configure the connection.

## **Models**

The **Models** panel displays your most recently used models. As the next figure shows, each entry lists the date and time that the model was last opened and shows its associated database. For further information about modeling, see Chapter 9, *Database Design and Modeling*.

Figure 4.3 Selecting Models from the Side Panel

To the right of the **Models** title are three icons. The (+) adds a new model, the (folder) opens an existing model from the disk, and the (>) opens a context menu for additional commands, such as **Create EER Model from Database**.

## Workbench Welcome Message

The welcome text and links are optional and can be removed or restored to the home screen when **MySQL Connections** is selected from the side panel. Links to the documentation, blog, and forums are also accessible from the **Help** menu.

- To remove the text and links, click the **x** icon above the welcome message.
- · To restore the text and links:
  - 1. Click Edit, Preferences, and then select Other.
  - 2. Select the **Show Welcome Message on Connections Screen** check box and then restart MySQL Workbench.

Manage and create MySQL connections.

# 5.1 Creating A New MySQL Connection (Simple)

To add a connection, click the [+] icon to the right of the **MySQL Connections** title on the home screen. This opens the **Setup New Connection** form, as the following figure shows.

Figure 5.1 Setup New Connection Form

### **Important**

The **Configure Server Management** button (bottom left) opens an optional configuration wizard for setting shell commands on the host. For example, commands to start/stop the MySQL instance, or to edit configuration file. For more information, see Section 5.3.7, "Configure Server Management Wizard".

Fill out the connection details and optionally click **Configure Server Management** to execute the Server Management wizard. Click **OK** to save the connection.

#### **Important**

When opening connections, MySQL Workbench automatically sets the client character set to utf8. Manually changing the client character set, such as using SET NAMES ..., may cause MySQL Workbench to not correctly display the characters. For additional information about client character sets, see Connection Character Sets and Collations.

New MySQL connections are added to the home screen as a tile, and the Section 8.2.1, "Object Browser and Editor Navigator" describes several MySQL Workbench features to monitor and configure each connected MySQL server. A single MySQL Workbench instance can open one or multiple MySQL connections into individual tabs.

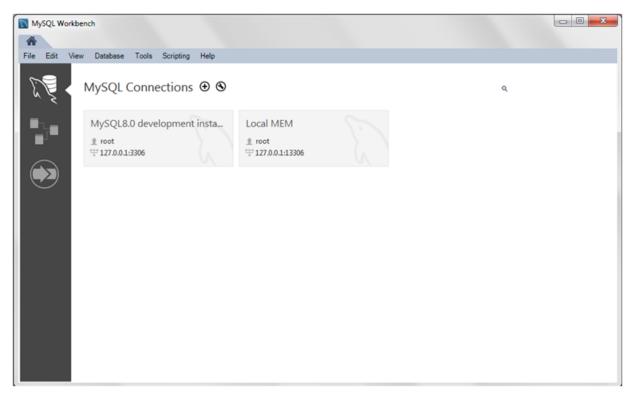

For a more detailed overview of this process, see the tutorial titled Section 5.2, "Creating A New MySQL Connection (Tutorial)".

# 5.2 Creating A New MySQL Connection (Tutorial)

1. Launch MySQL Workbench to open the home screen. Existing connections are shown when you click the MySQL Connections view from the sidebar. No connections exist for first-time users.

This tutorial adds a new connection that can be either an initial connection or an additional connection. An instance of MySQL server must be installed, started, and accessible to MySQL Workbench before you begin.

- 2. From the MySQL Workbench home screen, click the [+] icon near the MySQL Connections label to open the Setup New Connection wizard.
- 3. Define the **Connection Name** value, such as MyFirstConnection.

23 Setup New Connection Connection Name: MyFirstConnection Type a name for the connection Connection Method: Standard (TCP/IP) ▼ Method to use to connect to the RDBMS Parameters SSL Advanced Name or IP address of the server host. - TCP/IP port. Figure 5.3 Getting Started Tutorial - Setup New Connection: MyFirstConnection

The default connection values are for a typical local setup, so check them and enter the appropriate values. If you are unsure, click the **Test Connection** button to check the connection parameters. Do not press **OK**.

Next, optionally click **Configure Server Management...**, which opens up the **Configure Local Management** wizard:

4. Read the **Configure Local Management** introduction, and press **Next** to begin defining the new connection parameters.

Tisi dalog will help you to set up remote managemment for your connection. At the start a connection attempt is made to determine server version and operating system of the target machine. This allows you to validate the connection settings and allows the wizard to pick a meaningful configuration preset. If this attempt fails you can still continue, however.

Continue to the next page to start the connection. This might take a few moments.

Toggle the Show Logs to view additional details about the tested connection, then click Next.

- 6. Optionally, you may configure a method for remote management if a Remote Host was specified. Setting these options enables MySQL Workbench to determine the location of configuration files, and the correct start and stop commands to use for the connection.
  - SSH login based management and Native Windows remote management types are available. The Operating System and MySQL Installation Type are configured for the SSH login variant.
  - This step creates a local MySQL connection, so you can skip the **Management and OS** and **SSH Configuration** options, which are used for configuring a remote MySQL connection.

9. You now have a chance to review the configuration settings. The information displayed varies slightly depending on platform, connection method, and installation type.

At the **Review Settings** prompt, choose "I'd like to review the settings again" to review the settings. Choosing "Continue" closes the "Configure Server Management" dialog.

Check the **Change Parameters** if you want to check or edit information about the MySQL configuration file. For this example, select the check box and click **Next** to continue.

10. Review the MySQL configuration file information. Click the **Check** buttons to perform the described checks, or optionally change the configuration file path.

Alternatively, you can merge the Schemas and Management tabs by either clicking the merge icon on the top right of the Navigator panel, or by enabling the **Show Management Tools and Schema Tree in a single tab** SQL Editor preference.

This concludes the "Creating a MySQL connection" tutorial. For additional information about MySQL connections, see Chapter 5, *Connections in MySQL Workbench*.

# **5.3 Manage Server Connections**

The Manage Server Connections dialog is another way to manage MySQL connections. This dialog

is invoked by either clicking the manage connections icon ( ) on the home screen or by selecting **Database** and then **Manage Connections** from the main menu. It can also be invoked from any of the wizards requiring access to a live database.

After the MySQL connection manager is launched, you are presented with the **Connection** tab of the Manage Server Connections dialog. The following figure shows the initial connection options for a standard TCP/IP connection.

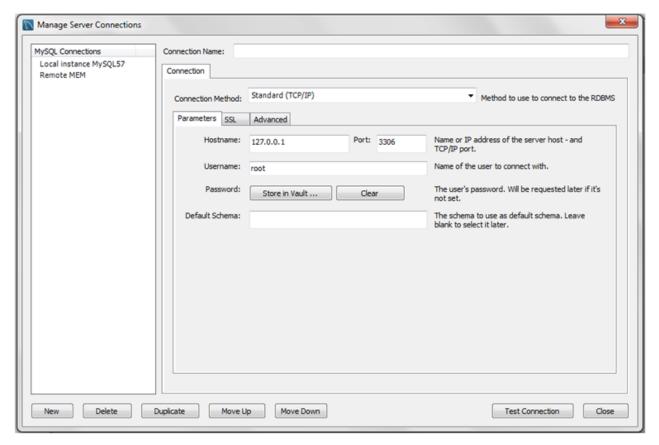

Figure 5.14 Manage Server Connections: Connection Tab

# **Elements of the MySQL Connection Manager**

- **Connection Name:** The name used to refer to this connection. This connection can then be selected from a list in other wizards requiring a connection.
- Connection Method: Method used to connect to the RDBMS.

After you select a connection method, the fields available in the **Parameters**, **SSL**, and **Advanced** tabs change accordingly. For more information about these options and parameters, see the specific section for each item.

- New button: Opens a separate Manage Server Connections dialog to create a new connection. This
  dialog provides two tabs in addition to the Connection tab: Remote Management and System Profile
- **Delete**, **Duplicate**, **Move Up**, and **Move Down** buttons: Operations used to manage the existing connections.
- **Test Connection** button: Tests the selected MySQL connection and reports the connection status. It also reports whether or not SSL is enabled.

For testing remote connections, you might also use ping to check the host name, or telnet to also check the port. If these fail, then also check the firewall settings on each host, and also that MySQL server is running on the remote host.

# **Notes on MySQL Connection Manager**

#### Note

Because TLSv1.2 requires OpenSSL, support for this protocol is available for MySQL Workbench Commercial Editions, and not for the Community Edition (which is compiled using yaSSL and supports TLSv1.1 only).

## Note

Simultaneous client connections: Opening a MySQL connection from the MySQL Workbench home screen opens a new connection tab in MySQL Workbench for that connection. Each of these tabs requires two MySQL connections to perform basic tasks, such schema discovery and SQL execution. Additionally, performing management related tasks, such as Server Status, requires two additional MySQL connections. Essentially, this means that each MySQL connection tab in MySQL Workbench requires four available connections to MySQL. For additional information about "Too many connection" related errors, see Too many connections.

This connection requirement doubles with each connection tab opened in MySQL Workbench, even if the two connection tabs point to the same MySQL server. SQL editor tabs share their connections, so having multiple SQL editor and SQL results tabs does not affect the number of required connections.

## 5.3.1 Standard TCP/IP Connection Method

This connection method enables MySQL Workbench to connect to MySQL Server using TCP/IP.

#### Note

The --skip-networking MySQL server configuration option affects the TCP/IP connection method. If disabled, use named pipes or shared memory (on Windows) or Unix socket files (on Unix).

#### **Parameters Tab**

The parameters for standard TCP/IP connections are:

• Hostname: The host name or IP address of the MySQL server.

#### Note

The host name "localhost" might resolve to "127.0.0.1" or "::1" on your host, so note this when checking permissions. For example, if a web application's user only has access to "127.0.0.1" on a host, and a defined connection uses "localhost" that resolves to "::1", this connection may lack the proper permissions to the aforementioned web application. Ping "localhost" on each host to determine where it resolves to.

- Port: The TCP/IP port on which the MySQL server is listening (the default is 3306).
- Username: User name to use for the connection.
- Password: Optional password for the account used. If you enter no password here, you will be prompted to enter the password when MySQL Workbench attempts to establish the connection. MySQL Workbench can store the password in a vault (see Section 5.3.8, "The Password Storage Vault").
- **Default Schema:** When the connection to the server is established, this is the schema that will be used by default. It becomes the default schema for use in other parts of MySQL Workbench.

## SSL Tab

SSL parameters are:

- Use SSL: This dropdown provides options related to enabling SSL encryption. Choose No to disable SSL, If available if the client library supports it, or Require to require SSL support for the MySQL connection to succeed. This option defaults to If available.
- SSL Key File: Path to the Key file for SSL.
- SSL CERT File: Path the Certificate file for SSL.
- SSL CA File: Path to the Certification Authority file for SSL.
- SSL Cipher: Optional list of permissible ciphers to use for SSL encryption.
- SSL Wizard button: Generate SSL certificates for both the MySQL server and MySQL client. Requires
  access to OpenSSL binaries in the system's PATH. For additional information, see Section 5.3.4, "SSL
  Wizard (Certificates)".
- **Files** button: Opens a file browser that points to the generated SSL files by the SSL Wizard. For additional information, see Section 5.3.4, "SSL Wizard (Certificates)"

## **Advanced Tab**

The **Advanced** tab includes these check boxes:

- **Use compression protocol**: If checked, the communication between the application and the MySQL server will be compressed, which may increase transfer rates. This corresponds to starting a MySQL command-line client with the --compress option. This option is unchecked by default.
- Use ANSI quotes to quote identifiers: Treat """ as an identifier quote character (like the "" quote character) and not as a string quote character. You can still use "" to quote identifiers with this mode enabled. With this option enabled, you cannot use double quotation marks to quote literal strings, because it is interpreted as an identifier. Note: If this option is checked, it overrides the server setting. This option is unchecked by default.
- Enable Cleartext Authentication Plugin: Send the user password in cleartext. Required for some authentication methods. This option is unchecked by default.
- Use the old authentication protocol: This option disables the Connector/C++ secure\_auth option. This option is unchecked by default. Doing so means you can connect to MySQL Server with MySQL users that utilize the old mysql\_old\_password authentication plugin, which is not recommended. mysql\_old\_password support was removed in MySQL Server 5.7.

#### Note

This option was removed in Workbench 6.3.6, and did not function in Workbench 6.3.5. For information about upgrading passwords from the old authentication protocol, see Section 5.3.9, "Updating Old Authentication Protocol Passwords".

Also, MySQL Server 5.7 does not support the old authentication protocol, because secure\_auth cannot be disabled. Using the old mysql\_old\_password has not been recommended since MySQL 4.1.

It also includes these options:

**Timeout:** Maximum time to wait before the connection is aborted. The connection times out in 60 seconds by default.

**SQL\_MODE**: Override the default SQL\_MODE used by the server.

**Others:** Other options for Connector/C++ as option=value pairs, one per line.

# 5.3.2 Local Socket/Pipe Connection Method

This connection method enables MySQL Workbench to connect to MySQL Server using a socket file (on Unix) or a named pipe (on Windows).

## **Parameters Tab**

In addition to a number of parameters that are in common with Standard TCP/IP connections, this connection method includes a unique field to configure the socket path or pipe name. As the following figure shows, you can supply the path to the socket file or pipe name within this dialog. If the field is left blank, the default socket or pipe name is used. On Unix, the default socket name is /tmp/mysql.sock. On Microsoft Windows, the default pipe name is MySQL.

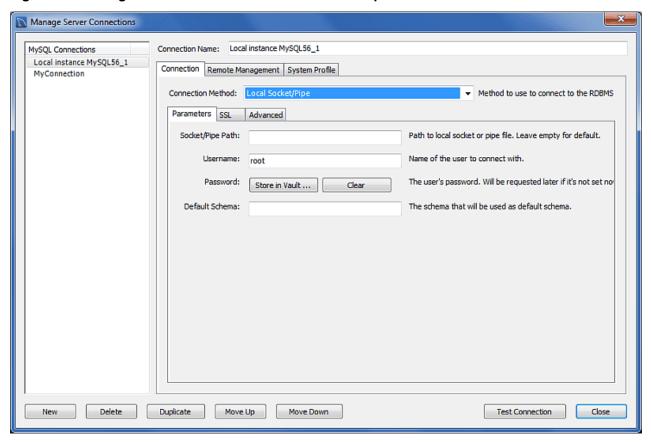

Figure 5.15 Manage Server Connections - Local Socket/Pipe Parameters

#### SSI Tab

The SSL options for this connection method are the same as the options described in Section 5.3.1, "Standard TCP/IP Connection Method".

## **Advanced Tab**

The advanced options for this connection method are the same as the options described in Section 5.3.1, "Standard TCP/IP Connection Method", except the **Use compression protocol** and **Timeout** options do not apply.

## 5.3.3 Standard TCP/IP over SSH Connection Method

This connection method enables MySQL Workbench to connect to MySQL Server using TCP/IP over an SSH connection.

#### Note

Because TLSv1.2 requires OpenSSL, support for this protocol is available for MySQL Workbench Commercial Editions, and not for the Community Edition (which is compiled using yaSSL and supports TLSv1.1 only).

## **Parameters Tab**

In addition to a number of parameters that are in common with Standard TCP/IP connections, this connection method features a number of specialized parameters. These options are:

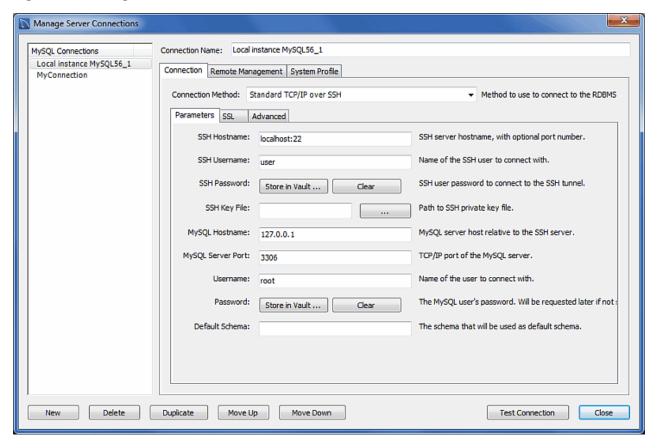

- **SSH Hostname:** The name of the SSH server. An optional port number can also be provided. For example, localhost: 22.
- SSH Username: The name of the SSH user to use to make a connection.
- SSH Password: The SSH password. It is recommended that an SSH key file is also used.
- SSH Key File: A path to the SSH key file.

If a remote host is missing from the system's list of known hosts, a prompt requires you to confirm the host's fingerprint before storing it. If your stored host fingerprint is different than the host's current fingerprint, then an error is generated and you will be required to handle the discrepancy from outside of MySQL Workbench before creating the connection. Prior to MySQL Workbench 6.1.6, the host SSH fingerprint was not saved by MySQL Workbench.

On Linux and macOS, SSH host fingerprints are stored in ~/.ssh/known\_hosts. On Microsoft Windows, they are stored in a file created by MySQL Workbench under the user's application data folder (%appdata %), such as C:\Users\[username]\AppData\Roaming\MySQL\Workbench\known\_hosts.

The following figure shows the SSH connection settings.

Figure 5.16 Manage Server Connections - Standard TCP/IP over SSH Parameters

#### SSL Tab

The SSL options for this connection method are the same as the options described in Section 5.3.1, "Standard TCP/IP Connection Method".

## **Advanced Tab**

The advanced options for this connection method are the same as the options described in Section 5.3.1, "Standard TCP/IP Connection Method", except the **Timeout** option does not apply.

# 5.3.4 SSL Wizard (Certificates)

This wizard helps create SSL certificates for both MySQL clients and MySQL servers. Connections in MySQL Workbench are updated with the certificates by the wizard. This wizard requires OpenSSL to create the certificates. An example MySQL configuration file (my.cnf/my.ini) is also generated that utilizes the generated certificates.

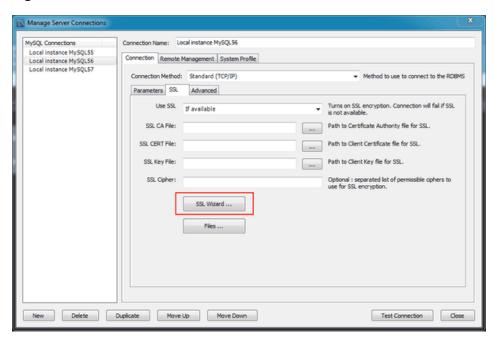

#### Note

The OpenSSL binary should be in the system's PATH.

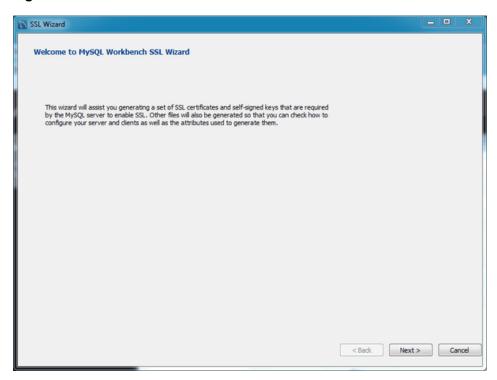

Start the SSL wizard from the **SSL** tab of a MySQL server connection. Locate this tab in the MySQL connection editor. Click **SSL Wizard** to execute the wizard, as the following figure shows.

Figure 5.17 SSL Wizard: Start

Read the informative text on the welcome screen (displayed in the following figure), and then click Next.

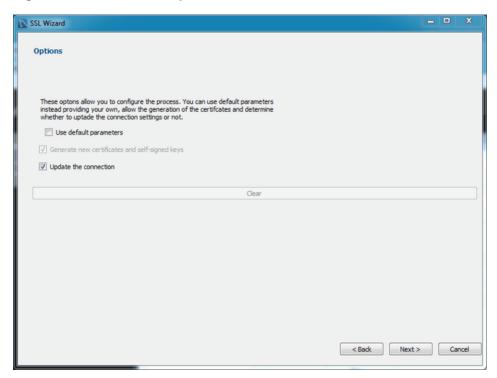

Figure 5.18 SSL Wizard: Welcome

Check the options that apply. The following figure shows an example of the available options.

- **Use default parameters**: Check this to skip entering the optional attributes, such as Country, State, Organization, and so on. By default, these fields are empty.
- Generate new certificates and self-signed keys: Check this to generate new files, otherwise the existing files are used. You might disable this if you already generated SSL certificates but forgot where the files are located, or how to configure them.
- **Update the connection**: Updates the defined MySQL connection (in Workbench) with the generated certificate information.

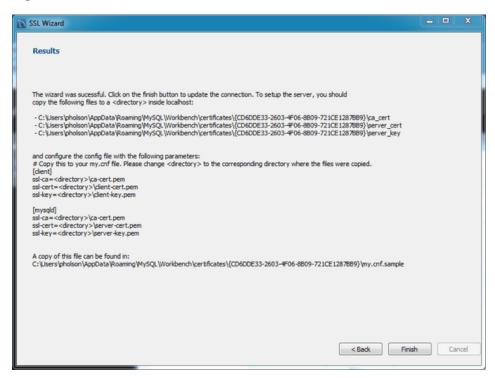

Figure 5.19 SSL Wizard: Options

The results page describes the generated files, and provides requirements that you must perform to complete the operation. For example, you must manually edit your MySQL configuration file (my.ini or my.cnf) and define the SSL options.

The following figure shows an example Results screen. Consider leaving this screen open, and close it after you copied the files and altered your MySQL configuration file to enable SSL connections. The wizard does not perform these actions for you.

Figure 5.20 SSL Wizard: Results

Here an example process of using the generated SSL files to set up an SSL connection. Adjust your paths as they will be different.

- 1. Create a directory to store the certificate files. In our simple example, we have MySQL Workbench installed on the same host as the MySQL Server, and we created "C:\certs" on this system.
- 2. Copy and paste the results to a new (temporary) file, but change <directory> to the path (C:\certs) we created. For example:

```
[client]
ssl-ca=C:\certs\ca-cert.pem
ssl-cert=C:\certs\client-cert.pem
ssl-key=C:\certs\client-key.pem

[mysqld]
ssl-ca=C:\certs\ca-cert.pem
ssl-cert=C:\certs\\server-cert.pem
ssl-key=C:\certs\\server-key.pem
```

#### Warning

MySQL Server interprets "\s" as a space, so we added an extra backslash to escape it. That is why you see "\\server-key.pem" in the above example, because MySQL Server would interpret "\server-key.pem" as " erver-key.pem".

3. Open the MySQL Server configuration file. In this example, its location is "C:\ProgramData\MySQL \MySQL Server 5.7\my.ini".

#### Note

The location of your configuration file depends on how MySQL Server was installed. The connection editor defines and displays its location, as does the **Options File** page in MySQL Workbench.

4. Add the client certificate information under the [client] section:

```
[client]
ssl-ca=C:\certs\ca-cert.pem
ssl-cert=C:\certs\client-cert.pem
ssl-key=C:\certs\client-key.pem
```

Add the server certificate information under the [mysqld] section:

```
[mysqld]
ssl-ca=C:\certs\ca-cert.pem
ssl-cert=C:\certs\\server-cert.pem
ssl-key=C:\certs\\server-key.pem
```

- 5. Update the paths to the SSL client certificates in your MySQL connection, under the SSL tab. There are three paths to update.
- 6. Restart the MySQL Server. In the log, you should see something like "Warning CA certificate C: \certs\ca-cert.pem is self signed."
- In MySQL Workbench's MySQL connection editor, clicking Test Connection should confirm your SSL connection.

Additionally, consider setting **Use SSL** to "Required". Or, if you are experiencing problems, set it to "If available" while debugging the problem.

# 5.3.5 Remote Management

The **Remote Management** tab is available when connecting to MySQL remotely, as the following figure shows. To access this tab, select a remote connection from the **MySQL Connections** pane or click **New** to create a new connection.

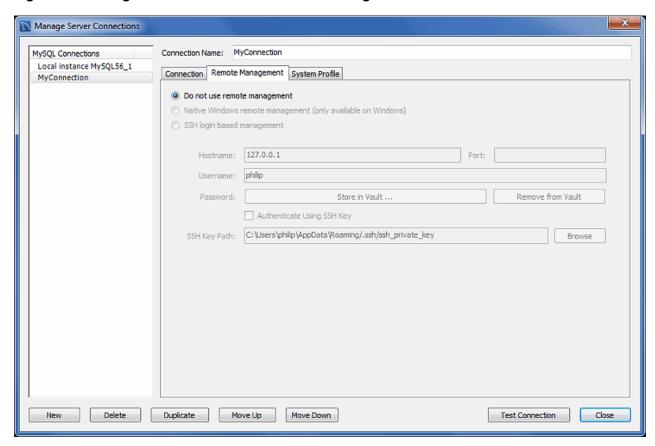

Figure 5.21 Manage Server Connections: Remote Management Tab

# 5.3.6 System Profile

The **System Profile** tab enables you to specify host-specific information. This is achieved primarily through selecting a **System Type**, along with its corresponding **Installation Type**. These profile settings contain standard information that is used in managing the host's MySQL instance.

Here are some of the available installation types:

- · FreeBSD, MySQL package or Custom
- Linux, including distributions such as Fedora, Oracle, RHEL, SLES, Ubuntu, Generic, and Custom
- · macOS, MySQL package or Custom
- · OpenSolaris, MySQL package or Custom
- · Windows, with different installation methods, MySQL versions, and build architectures

Choose the appropriate **System Type** and **Installation Type** to set default parameters that includes commands used to start and stop MySQL, commands to check the server status, the location of the my.ini or my.cnf configuration file, and on Windows, the Windows Service Name. As the following figure shows, these default values are customizable.

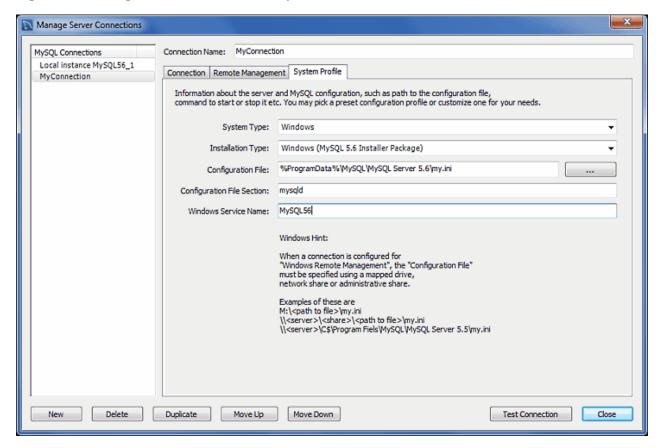

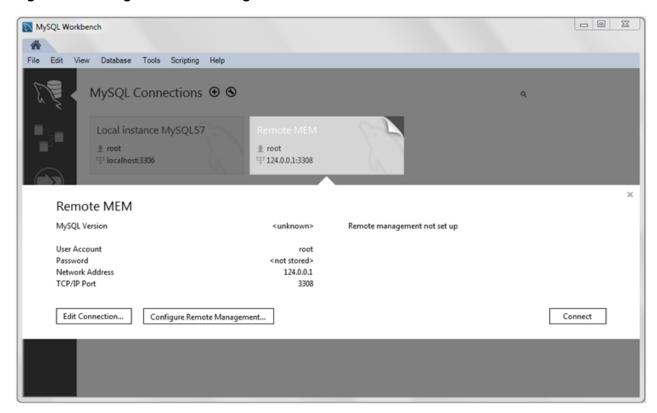

Figure 5.22 Manage Server Connections: System Profile Tab

# 5.3.7 Configure Server Management Wizard

Clicking the [+] icon from the home screen launches the **Setup New Connection** wizard. The wizard provides a MySQL connection form to create a new MySQL connection, and includes a **Configure Server Management** option as a step-by-step approach to creating a new MySQL server connection.

This option can also be executed later (on remote connections) from the home screen by clicking the top right corner of a MySQL remote connection, as the following figure shows.

Figure 5.23 Configure Remote Management

Executing this wizard is required to perform tasks requiring shell access to the host. For example, starting/stopping the MySQL instance and editing the configuration file.

For a tutorial that demonstrates the steps outlined below, see the tutorial titled Section 5.2, "Creating A New MySQL Connection (Tutorial)".

The steps presented in the wizard are as follows:

### 1. Test DB Connection

On this page, MySQL Workbench tests your database connection and displays the results. If an error occurs, click **Show Logs** to view the related logs.

## 2. Management and OS

Used to specify a remote management type and target operating system, which is available when the Host Machine is defined as a remote host.

The SSH login based management option includes configuration entries for the Operating System and MySQL Installation Type.

#### 3. SSH Configuration

If you specified a Remote Host on the Specify Host Machine page, you will be presented with the Host SSH Connection page, that enables you to use SSH for the connection to the server instance. This facility enables you to create a secure connection to remotely administer and configure the server instance. You must enter the host name and user name of the account that will be used to log in to the server for administration and configuration activities. If you do not enter the optional SSH Key for

use with the server, then you will be prompted for the password when the connection is established by MySQL Workbench.

#### Note

This connection is to enable remote administration and configuration of the MySQL Server itself. It is not the same as the connection used to connect to a server for general database manipulation.

#### Note

You must use an SSH connection type when managing a remote server if you wish to start or stop the server or edit its configuration file. Other administrative functions do not require an SSH connection.

#### 4. Windows Management

If a Windows server is used, then setting the Windows configuration parameters is mandatory. Windows management requires a user account with the required privileges to query the system status, and to control services. And read/write access to the configuration file is needed to allow editing of the file.

#### 5. Test Settings

The wizard now attempts a connection to your server and reports the results. If an error occurs, click **Show Logs** to view the related logs.

MySQL Workbench must know where the MySQL Server configuration file is located to be able to display configuration information. The wizard is able to determine the most likely location of the configuration file, based on the selection made on the Operating System page of the wizard. However, it is possible to test that this information is correct by clicking the **Check path** and **Check section** buttons. The wizard then reports whether the configuration file and server configuration section can in fact be accessed. It is also possible to manually enter the location of the configuration file, and the section pertaining to MySQL Server data; these manually entered values should be tested using the buttons provided. Click the **Next** button to continue.

## 6. Review Settings

The modified settings may be reviewed, which also includes the default values. Check the Change Parameters checkbox if the MySQL Config File section will be edited, and then click **Next** to continue.

## 7. MySQL Config File

Allows configuration of the MySQL server version. It also allows the editing and validation of the configuration file path, and validation of the server instance section. Click **Next** to continue.

#### 8. Specify Commands

Optionally set the commands required to start, stop, and check the status of the running MySQL server instance. Commands can be customized, if required, but the defaults are suitable in most cases. The defaults depend on the selected options on the **Operating System** page of the wizard. Click **Next** to continue.

## 9. Complete Setup

Name the MySQL server instance on the final step. This name is used throughout MySQL Workbench as a reference to this MySQL connection. After setting a suitable name, click **Finish** to save the instance.

# 5.3.8 The Password Storage Vault

The vault provides a convenient secure storage for passwords used to access MySQL servers. By using the vault, you need not enter credentials every time MySQL Workbench attempts to connect to a server.

#### Note

The hostname is used for storing password information. For example, a local connection might use "localhost", "127.0.0.1", or "::1", but these are stored separately in the password storage vault, even if they all resolve to the same place.

The vault is implemented differently on each platform:

- Windows: The vault is an encrypted file in the MySQL Workbench data directory. This is where connections.xml and related files are located. The file is encrypted using a Windows API which performs the encryption based on the current user, so only the current user can decrypt it. As a result it is not possible to decrypt the file on any other computer. It is possible to delete the file, in which case all stored passwords are lost, but MySQL Workbench will otherwise perform as expected. You then must re-enter passwords as required.
- macOS: The vault is implemented using the Secure Keychain. The keychain contents is also viewable from the native Keychain Access.app utility.
- **Linux**: The vault works by storing passwords using the <code>gnome-keyring</code> daemon, which must be running for password persistence to work. The daemon is automatically started in GNOME desktops, but normally is not in KDE and others. The <code>gnome-keyring</code> daemon stores passwords for MySQL Workbench on non-GNOME platforms, but it must be started manually.

# 5.3.9 Updating Old Authentication Protocol Passwords

MySQL 4.1 extended password hashes from 16 to 41 bytes. However, upgrading MySQL does not automatically update the old password passwords, so existing passwords continue to be stored in the deprecated format. This is because MySQL does not store passwords as plain text, so regenerating password hashes requires user intervention.

The associated secure\_auth option was enabled by default as of MySQL 5.6. It is always enabled as of MySQL 5.7, meaning it can *not* be disabled. A future MySQL release will remove this option. With this option enabled, a user with a password defined in the old format will not be able to login to MySQL.

With all that said, the deprecated password format does not function with MySQL 5.7. All passwords using the old format must be updated. This section documents how to upgrade these passwords using MySQL Workbench. For information about migrating away from the old password format using the MySQL command line instead of Workbench, see Migrating Away from Pre-4.1 Password Hashing and the mysql\_old\_password Plugin.

#### Note

The method that MySQL stores a password is defined by an authentication plugin. The old method uses the mysql\_old\_password authentication plugin, and the current default method uses mysql\_native\_password. As of MySQL

5.6, a sha256\_password option is also available although it requires an SSL or encrypted connection. When Workbench upgrades passwords, it upgrades mysql\_old\_password to mysql\_native\_password. For additional information about authentication plugins, see Pluggable Authentication.

## Options Depend on your secure\_auth Option

Upgrading a password does have constraints. Here are two scenarios:

 If the secure\_auth MySQL Server option is disabled, then you can log in using the user with the old password format and update the user's own MySQL password. However, this is not an option as of MySQL Workbench 6.3.5 because compatibility with the old password format was removed. For this reason, a user's ability to upgrade their own password format must be done using the MySQL command line as described in Migrating Away from Pre-4.1 Password Hashing and the mysql\_old\_password Plugin.

#### Note

If using the MySQL command line is not an option, then you could use an older version of MySQL Workbench (version 6.3.4 and earlier), which allows you to enable a Use the old authentication protocol option under the **Advanced** connections tab. Older versions of Workbench are available at https://downloads.mysql.com/archives/workbench/.

As stated earlier, secure\_auth is enabled by default as of MySQL 5.6, and always enabled as of MySQL 5.7.

• If secure\_auth is enabled, you can not log in if your user's password is stored in the old format. Attempts will fail and emit an error similar to "ERROR 2049 (HY000): Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure\_auth' enabled)". To upgrade the password, you can either disable secure\_auth (not recommended) then update as described above, or log in as a different and privileged user, such as root, to change the password for a different user.

## **Using Workbench to Upgrade Your Password**

Keeping the above in mind, there are two methods to update passwords using Workbench.

Open the Users and Privileges tab from Workbench's Management navigator. Select the user you want to update from the User Accounts section. If using the old password format, you will see text beginning with "This account is using the pre-mysql-4.1.1 password hashing type." in the lower right corner of the screen, and also a large Upgrade button on the right. From here, you can:

Option for all MySQL versions:

Manually enter a new password, or the current password, and click **Upgrade**. This upgrades the password to the newer password format, and the MySQL user can now log in using the new password that you defined.

Option for MySQL 5.6 and later:

Rather than editing the password field, leave it alone and immediately click **Upgrade**. From here, you can generate a random password and tag it as expired by clicking **Reset To Expired**. Use this temporary random password to login the user, and MySQL will prompt for a new password when the user first logs in.

The following figures demonstrate the sequence of steps used in both methods:

Figure 5.24 Upgrade Old Password: Setting a New Password

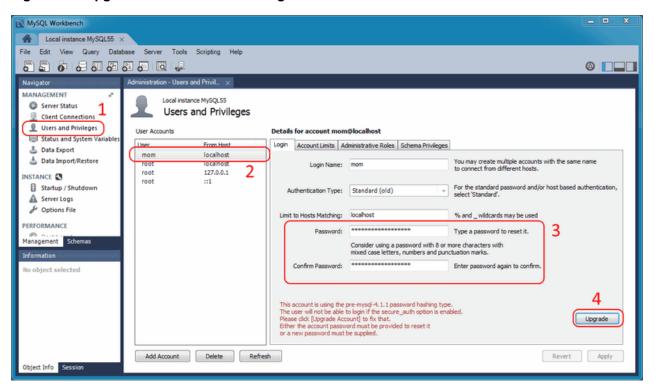

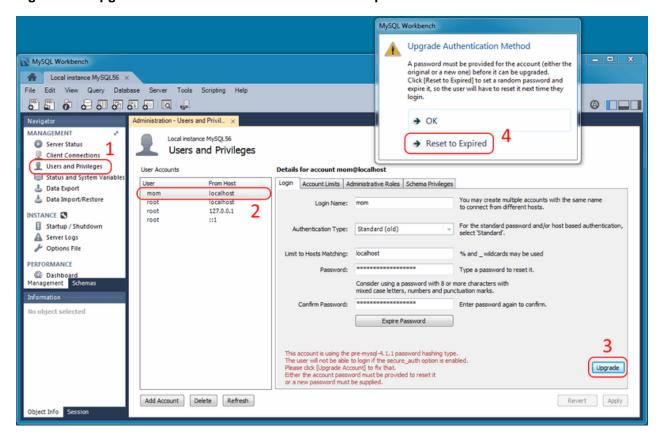

Figure 5.25 Upgrade Old Password: Reset to Random Expired Password

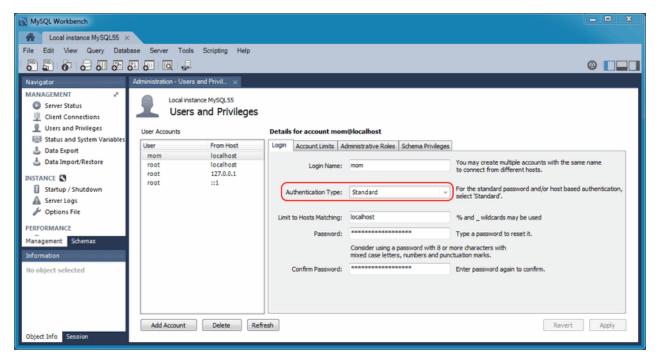

When resetting to a random password, you must save the password and give it to the user. You will find the random password in the new popup window that is similar to the following figure.

Figure 5.26 Upgrade Old Password: Random Password Popup

After completing the upgrade, notice the new **Authentication Type** for the connection. In the example shown in the next figure, the value changed from **Standard (old)** to **Standard**. In other words, the authentication type changed from mysql\_old\_password to mysql\_native\_password.

Figure 5.27 Upgraded Password: Standard (old) to Standard

# **5.4 Client Connections**

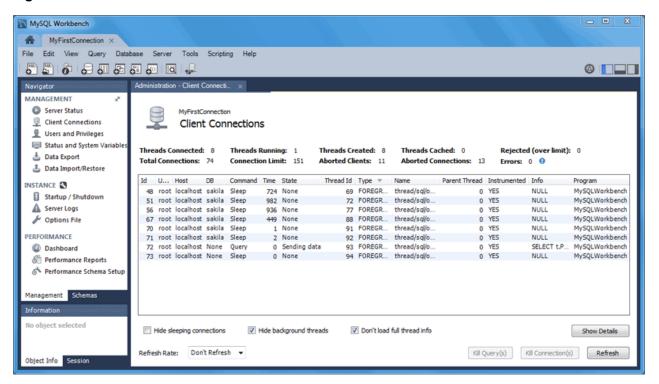

The client connection browser lists the active and sleeping MySQL client connections, and adds the ability to kill statements and connections, and view additional connection details and attributes. The following figure shows an example of client connection information for a local host.

#### Note

The connection details viewer requires MySQL 5.6 or higher. Only basic connection information is available for previous versions of MySQL, such as the connection hosts, database, and state.

Figure 5.28 Client Connection Overview

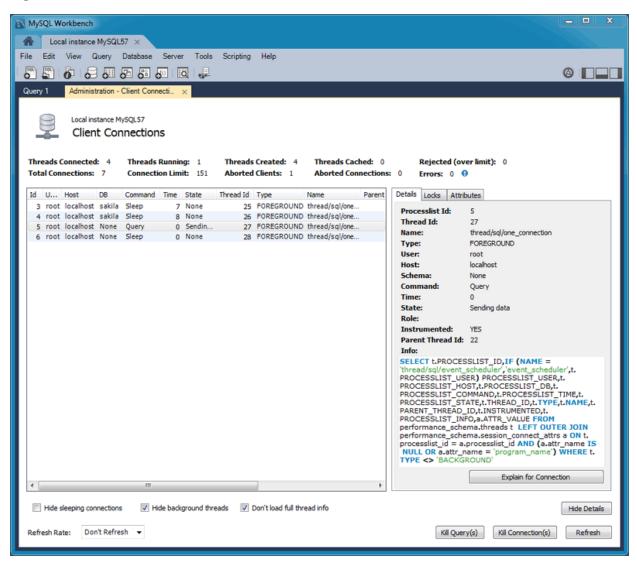

# **Client Connections and Metadata Locks**

The **Client Connections** management window includes a **Show Details** for connections to MySQL 5.6 and higher, as the following figure shows. These details are separated into three tabs:

 Details: connection details such as Process ID, Type, User, Host, Instrumented, and additional information.

Locks: MySQL uses metadata locking to manage access to objects such as tables and triggers.
 Sometimes a query might be blocked while being manipulated by another connection from another user.
 The Locks feature (shown in the following figure) utilizes these MySQL metadata locks (MDL) to show the locked connections that are blocked or being waiting on, and shows information about the locks, what they are waiting for, and what they hold.

Figure 5.30 Metadata Locks Browser

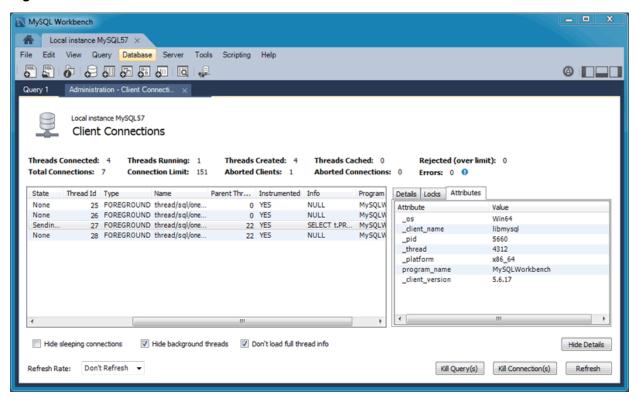

#### Note

The metadata lock information is provided in the performance schema as of MySQL server 5.7.3.

• Attributes: these are connection attributes such as OS, Client Name, Client Version, and Platform. The following figure shows a set of attributes and values.

MySQL Workbench provides a visual GUI to administer your MySQL environment. The available visual tools help configure your MySQL servers, administer users, perform backup and recovery, inspect audit data, and view database health.

# **6.1 Server Management**

Manage your MySQL instances with a comprehensive view of your MySQL server connections. The visual tree based navigation provides detailed information about server and status variables, including the number of threads, bytes sent and received by clients, buffer allocations size, and more.

# 6.1.1 MySQL Connection Navigator

The Navigator panel has a **Management** tab with functionality to monitor and configure your selected MySQL connection.

#### **Note**

The Navigator panel also has a **Schemas** tab for managing databases using your MySQL Connection. For information about the Schemas tab, see Section 8.2.1, "Object Browser and Editor Navigator".

Figure 6.1 SQL Editor - Navigator Management Tab

The Navigator Management tab is separated into the **MANAGEMENT**, **INSTANCE**, and **PERFORMANCE** sections, and the Commercial edition of MySQL Workbench also includes the **MYSQL ENTERPRISE** section.

# 6.1.2 Server Logs

The **Administration - Server Logs** tab displays log information for the MySQL server represented by each connection tab. For each connection, the **Administration - Server Logs** tab includes additional tabs for the general error logs and the slow logs (if available).

With a valid connection established, and the connection tab for it open, you can access log information from either the Navigator panel or by clicking **Server** and then **Server Logs** from the menu.

# **Error Log File**

The following figure shows an example of entries within the **Error Log File** tab. For more information, see The Error Log.

# 6.1.3 Service Control

The **Administration - Startup / Shutdown** tab enables you to perform the following service-control actions:

- · View the Startup Message Log.
- Start up and shut down the MySQL instance.
- View the current status of the MySQL instance.

With a valid connection established, and the connection tab for it open, you can access the control actions from either the Navigator panel or by clicking **Server** and then **Startup/Shutdown** from the menu. The following figure shows an example of the **Administration - Startup / Shutdown** tab with the database server instance running and the **Stop Server** button displayed.

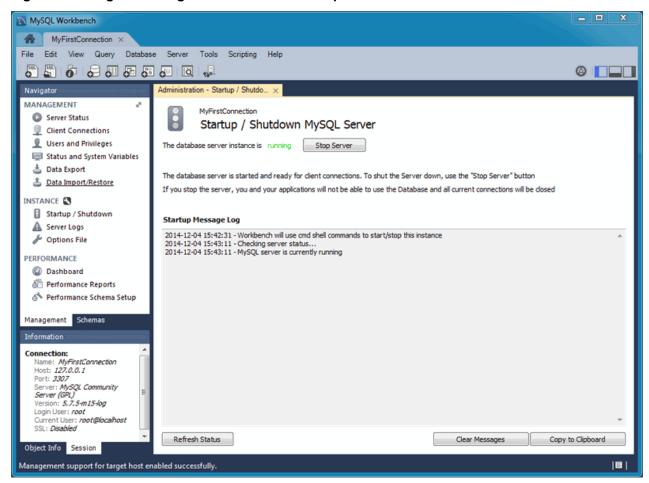

Figure 6.4 Navigator Management: Instance: Startup / Shutdown

# 6.1.4 Configuration (Options File)

The **Options File** editor is used to view and edit the MySQL configuration file (my.ini on Windows, or my.cnf on Linux / macOS) by selecting check boxes and other GUI controls, and then making edits. MySQL Workbench divides the options file into its own groupings as a set of tabs (such as **General**, **Logging**, **InnoDB**, and more). Make an edit and click **Apply** to commit the changes.

Access this window from either the Navigator panel, or by selecting **Server**, **Options File** from the main menu.

The options file editor includes the following components:

- · Option file groupings, as divided into convenient tabs by MySQL Workbench
- A Locate option search field to search your MySQL options configuration file
- Configuration File path, so you know the configuration file you are editing
- An options file group selector, to select the option [group] to edit. Because the same option can be
  defined under multiple groupings, it is important to choose the correct group when making edits.
  [mysqld] (the MySQL server) is the default and most common group. For additional information about
  groups, see Using Option Files.

The following figure shows an instance of the **Options File** with the **General** tab selected:

Access this window from either the Navigator panel, or by selecting **Server**, **Users and Privileges** from the main menu.

The Users and Privileges page has several sections:

## **User Accounts**

Lists each user account that is associated to the active MySQL connection.

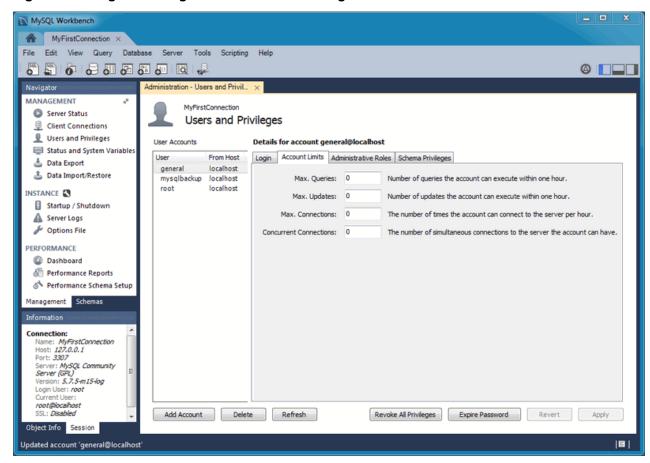

Figure 6.7 Navigator Management: User And Privileges: Account Limits

# **Administrative Roles**

To aid in assigning privileges to MySQL Server users, MySQL Workbench introduces the concept of Administrative Roles. Roles are a quick way of granting a set of privileges to a user, based on the work the user must carry out on the server. It is also possible to assign multiple roles to a user. To assign roles, click the User Account you wish to modify, then click the **Administrative Roles** tab. Then click the check boxes according to the roles you wish to allocate to the user. After you select a role to a user, you will see the accumulated privileges in the **Global Privileges Assigned to User** panel. For example, if you select the role BackupAdmin, the privileges granted include EVENT, LOCK TABLES, SELECT, SHOW DATABASES. If you also select the role of ReplicationAdmin, the list of privileges expands to include REPLICATION CLIENT, REPLICATION SLAVE and SUPER.

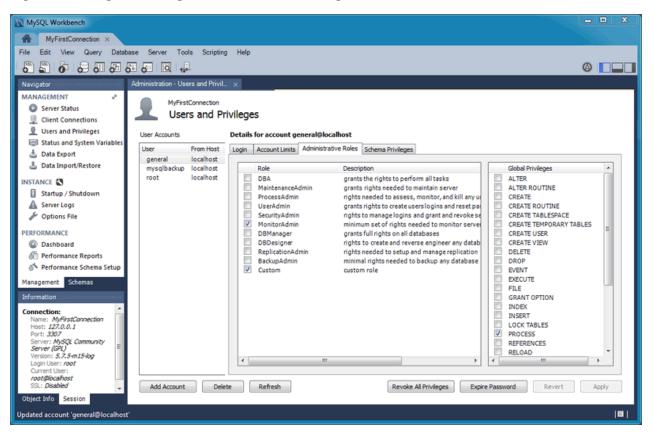

These roles are available:

- DBA: Grants all privileges
- MaintenanceAdmin: Grants privileges to maintain the server
- ProcessAdmin: Grants privileges to monitor and kill user processes
- UserAdmin: Grants privileges to create users and reset passwords
- SecurityAdmin: Grants privileges to manage logins and grant and revoke server privileges
- MonitorAdmin: Grants privileges to monitor the server

- **DBManager**: Grants privileges to manage databases
- DBDesigner: Grants privileges to create and reverse engineer any database schema
- ReplicationAdmin: Grants privileges to set up and manage replication
- BackupAdmin: Grants privileges required to back up databases
- Custom: Lists other (custom) privileges that are assigned to the user account

The *Password Validation Plugin* (available as of MySQL Server 5.6.6) is supported in Workbench. For information about what these settings mean, see The Password Validation Plugin.

# Schema Privileges

Additional schema privileges that the account can use. For example, the standard mysqlbackup user has "CREATE TEMPORARY TABLES" on the mysql schema.

## 6.3 Server Status

Get an immediate view into the basic health indicators and counters for your MySQL environment. This includes viewing the server's running state (stopped/running), available features, primary server directories, replication state, and security settings for authentication and SSL. Reports also include information and graphs to track memory usage, connections, hit rates, and more.

Access this window from either the Navigator panel, or by selecting **Server**, **Server Status** from the main menu.

# 6.4 Status and System Variables

**Status and System Variables**: Lists all server variables for the MySQL connection. You may also copy all or selected variables to your clipboard.

Access this window from either the Navigator panel, or by selecting **Server**, **Status and System Variables** from the main menu.

Figure 6.11 Navigator Management: Status Variables

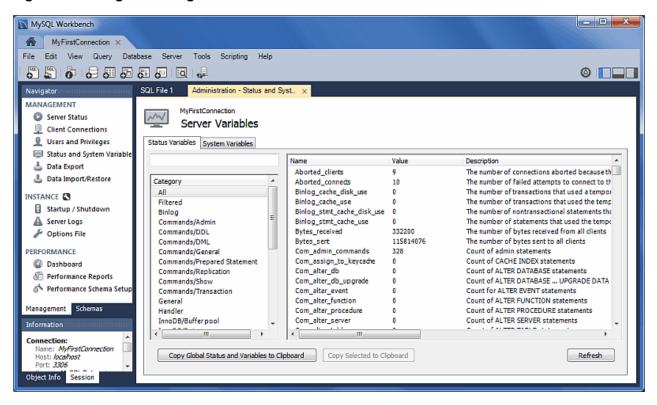

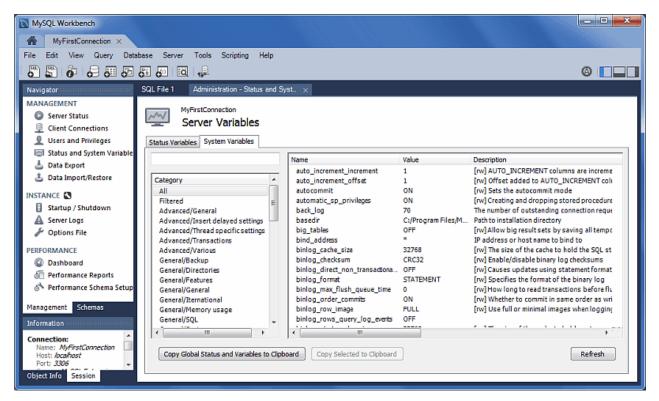

Figure 6.12 Navigator Management: System Variables

### **Custom Variable Grouping**

The status and system variables are each categorized by groups (such as InnoDB or Logging), and you may also create your own custom groups. Right-click on a variable, choose the custom group (or create a new one), and add the variable to the aforementioned group. Your custom groups are listed along with the pre-existing groups.

In the following example, we created a custom group titled "My Variables" and are in the process of adding the Created\_tmp\_variables variable to it.

## 6.5 Data Export and Import

There are three ways to export and import data in MySQL Workbench, each serving a different purpose.

Table 6.1 Methods to Export or Import data in MySQL Workbench

GUI Location	Data Set	<b>Export Types</b>	Import Types	Additional Details
Object Browser context menu	Tables	JSON, CSV	JSON, CSV	Simple table operations, includes moderate control over the output type (this method was added in version 6.3.0)
Result Grid menu under the SQL editor	Result set (after performing an SQL query)	CSV, HTML, JSON, SQL, XML, Excel XML, TXT	CSV	Simple data operations, includes little control

# 6.5.1 Table Data Export and Import Wizard

This wizard supports import and export operations using CSV and JSON files, and includes several configuration options (separators, column selection, encoding selection, and more). The wizard can be performed against local or remotely connected MySQL servers, and the import action includes table, column, and type mapping.

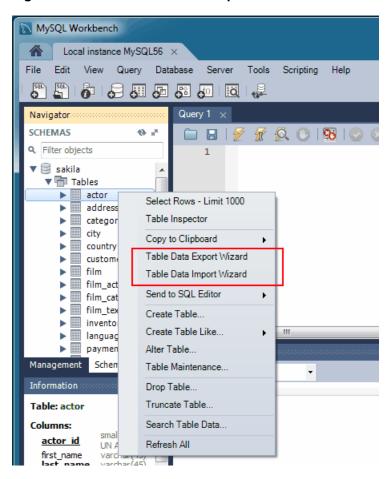

#### Note

This wizard only exports/imports tables using the JSON or CSV format. For an overview of the data export and import options in MySQL Workbench, see Section 6.5, "Data Export and Import".

The wizard is accessible from the object browser's context menu by right-clicking on a table and choose either **Table Data Export Wizard** or **Table Data Import Wizard**.

## 6.5.2 SQL Data Export and Import Wizard

Use this wizard to either export or import SQL generated from MySQL Workbench or with the mysqldump command.

Access these wizards from either the Navigator panel, or by selecting **Server** from the main menu, and then either **Data Import** or **Data Export**.

#### Note

This wizard only exports/imports the MySQL SQL format. For an overview of the data export and import options in MySQL Workbench, see Section 6.5, "Data Export and Import".

### **Data Export**

This tab allows you to export your MySQL data. Select each schema you want to export, optionally choose specific schema objects/tables from each schema, and generate the export. Configuration options include exporting to a project folder or self-contained SQL file, optionally dump stored routines and events, or skip table data.

#### Note

Alternatively, use Export a Result Set to export a specific result set in the SQL editor to another format such as CSV, JSON, HTML, and XML.

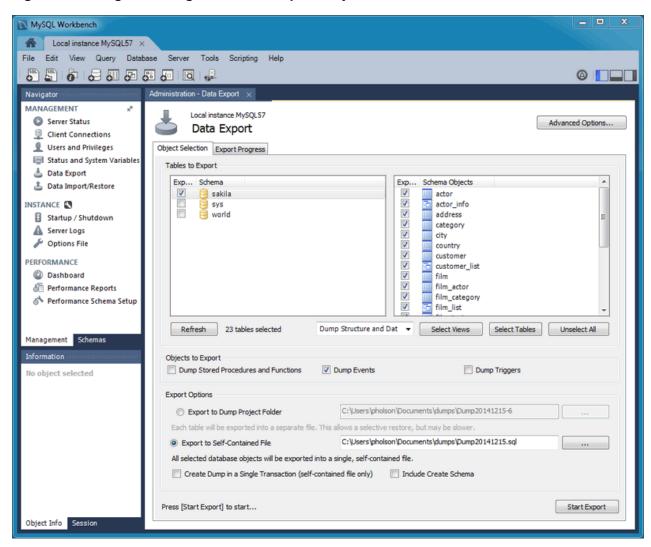

Select the Database objects to export, and configure the related options.

#### Note

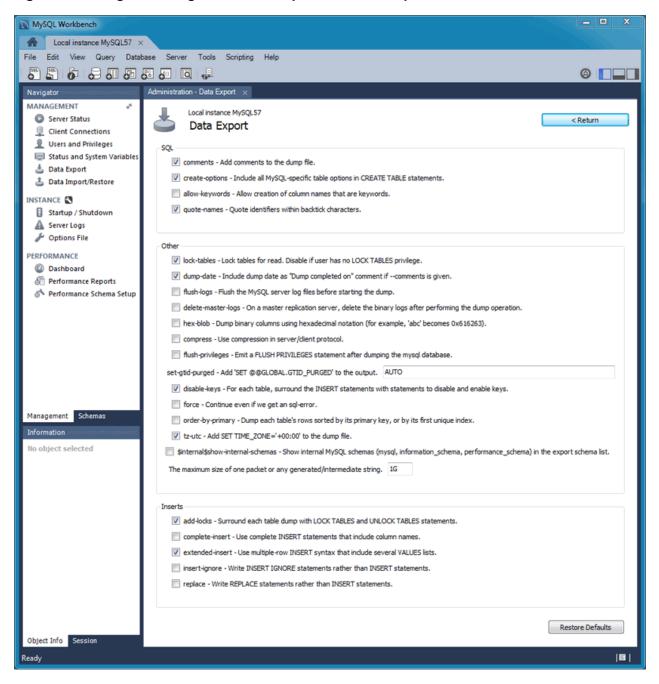

Click Refresh to load the current objects.

Figure 6.22 Navigator Management: Data Export: Object Selection

Optionally open the **Advanced Options** tab that allows you to refine the export operation. For example, add table locks, use replace instead of insert statements, quote identifiers with backtick characters, and more.

## 6.5.3 Result Data Export and Import

Export or Import data directly from or into the result set.

### **Export a Result Set**

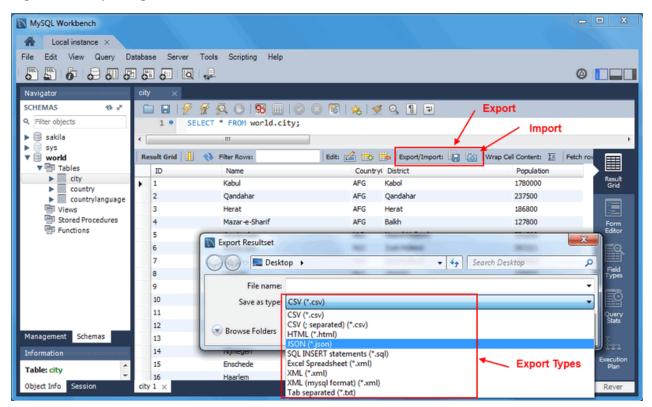

A result set in the visual SQL editor can be exported to common file formats including CSV, JSON, HTML, and XML.

#### Note

This wizard only exports/imports data from a result set. For an overview of the data export and import options in MySQL Workbench, see Section 6.5, "Data Export and Import".

Figure 6.27 Exporting a Result Set

### Import into a Result Set

Records from a CSV file can be imported into the result set of the visual SQL editor.

#### Note

The result set must have a unique row identifier (such as a Primary Key or NOT NULL unique index) as otherwise values can not be imported because the result set will be read-only.

#### Note

Alternatively, use Section 6.5, "Data Export and Import" to export larger sets of data, such as entire tables and databases.

# 6.6 MySQL Audit Inspector Interface

MySQL Workbench offers a GUI interface to the Audit Inspector.

Initially, when you first load the **Audit Inspector**, you must use MySQL Workbench to cache the audit log for performance reasons. MySQL Workbench will then parse, index, and retrieve values from the encrypted cached file on your local computer.

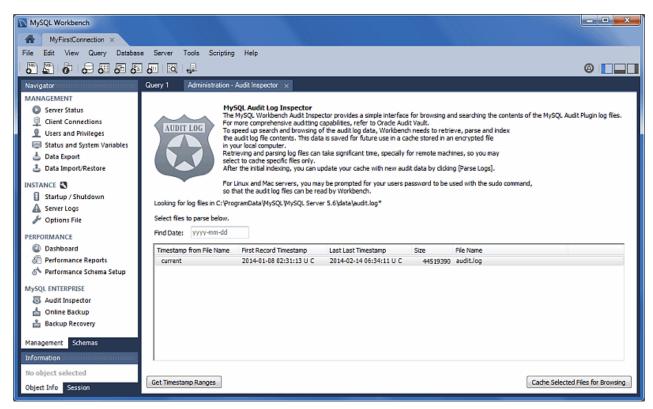

#### **Note**

MySQL Workbench will prompt for **sudo** access if the MySQL Workbench user is unable to read the audit log file.

At this stage, you also set a password for the encrypted file that will be used when viewing this file. The initial screen looks similar to the figure that follows:

Figure 6.28 Workbench: Audit Inspector: Initializing

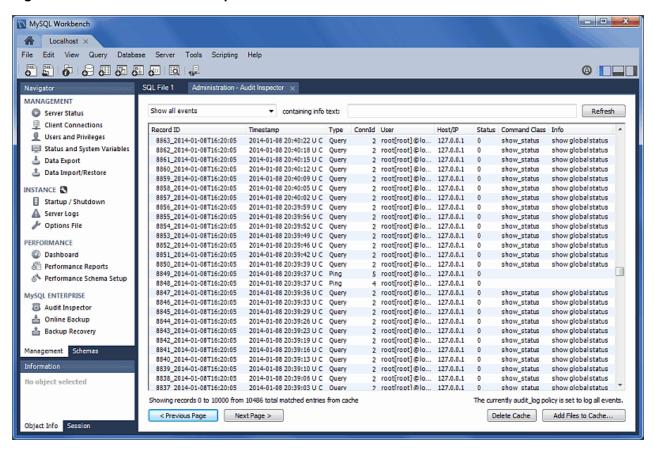

#### Note

Generating the cache file can take a long time. If you press **Abort** during the caching process, MySQL Workbench will save the results that were cached at the point you pressed **Abort**.

After caching an audit log, the **Audit Inspector** page will display the results as shown in the following figure:

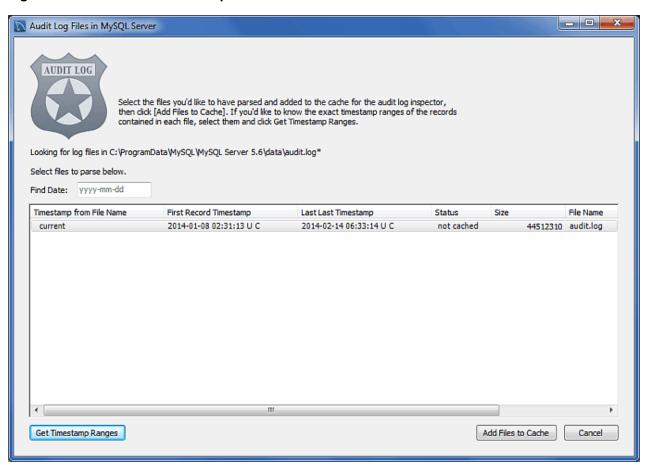

Figure 6.29 Workbench: Audit Inspector

The search field offers criteria for narrowing the displayed events, including **Show events of type Fetch** and **Show events of type Query**, and defaults to **Show all events**. Custom filters are also available.

You can **Add Files to Cache** from the main Audit Inspector page. The following figure shows an example file to add:

Figure 6.30 Workbench: Audit Inspector: Add Files to Cache

Future uses of the **Audit Inspector** will require the password that you set during the initial step. The next figure shows that the audit log cache is locked:

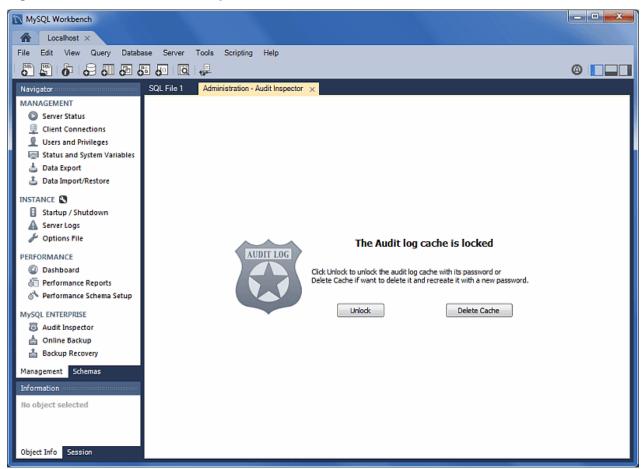

Figure 6.31 Workbench: Audit Inspector: Unlock

# 6.7 MySQL Enterprise Backup Interface

MySQL Workbench include a MySQL Enterprise Backup GUI interface that is listed in the Management Navigator tab for a MySQL connection. There are two MySQL Enterprise Backup related sections in the Navigator:

- Online Backup: Sets a backup profile that defines what should be backed up, where the backup should be stored, and when (the frequency) MySQL should be backed up.
- **Restore**: Restores the MySQL server to a specific point in time, typically by restoring a backup that was created by the **Online Backup** feature in MySQL Workbench.

For information comparing the different methods to import/export data using MySQL Workbench, see Section 6.5, "Data Export and Import".

The MySQL Enterprise Backup configuration is located on the MySQL server, and not locally. This information includes the MySQL Enterprise Backup configuration backup profiles, job scheduling, backup operations, and data. This also means that the backup operations are executed with (or without) MySQL Workbench running.

# 6.7.1 General Requirements

MySQL Enterprise Backup is a MySQL Enterprise Feature that is separate from MySQL Workbench. For more information about its functionality, see the MySQL Enterprise Backup documentation at http://

dev.mysql.com/doc/mysql-enterprise-backup/en. MySQL Workbench provides an interface to MySQL Enterprise Backup, as described in the following documentation. In addition to having MySQL Enterprise Backup installed on your host, the following general requirements also apply:

- A recent version of MySQL Enterprise Backup. The MySQL Enterprise Backup support policy is to support the current GA version of MySQL Enterprise Backup, and the major version before that. This dictates the minimum MySQL Enterprise Backup version required by MySQL Workbench, which is the major version before the current GA release.
- Managing both local and remote MySQL instances is available on Linux and macOS, and managing local MySQL instances is available on Microsoft Windows. Remote management is configured using SSH Remote Management.
- A MySQL connection with a root user.
- The MySQL server configuration file path must be set and correct for the MySQL connection.
- The user running MySQL Workbench must be a sudo user (Linux / OS X) that is able to execute the MySQL Enterprise Backup binary.
- Additionally, the sudo user must keep the HOME environment variable when executing system commands, which means adding the following to /etc/sudoers:

```
env_keep +="HOME"
```

#### And the **Prerequisites** set in the **Settings** tab are:

- A path to the MySQL Enterprise Backup executable. MySQL Enterprise Backup is available via eDelivery or My Oracle Support (MOS). MySQL Workbench attempts to locate the MySQL Enterprise Backup executable, so check the path and adjust it accordingly.
- The path to the **Backup Home Directory**, where backup profiles and data is stored. This can be created from within Workbench from the **Settings** tab.
- The MySQL account for the **Backup Process**. The available actions depends on the current state of this set up, with options including:
  - Create MEB Account: Available if a backup user does not already exist.
  - Change Password: Available if a backup user does exist.
  - Fix Grants for MEB...: Available if the user's privileges are invalid, which alters the user by adding the RELOAD, SUPER, and REPLICATION CLIENT ON \*.\* privileges.

#### **Uninstalling Workbench notes**

- Uninstalling Workbench does not remove the associated MySQL Enterprise Backup backup tasks.
   To stop the scheduled backups, edit the related "Task Scheduler" entries on Windows, or remove the associated cron jobs on Linux and macOS.
- Uninstalling Workbench does not remove the MySQL Enterprise Backup master related configuration file, the configuration files generated for each defined profile, nor the MySQL backups.

The following figure shows an example of the **Settings** tab.

## 6.7.2 Online Backup

Sets a backup profile that defines what should be backed up, where the backup should be stored, and when (the frequency) it should be backed up. The following figure shows an example of the main page.

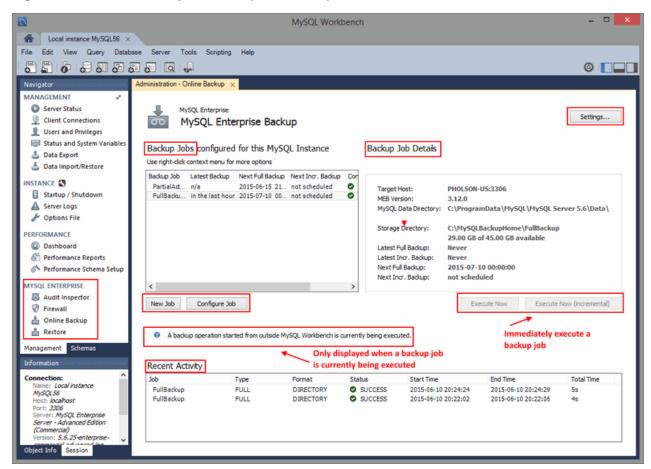

Figure 6.33 Workbench: MySQL Enterprise Backup

The **Online Backup** page is separated into three sections:

• **Backup Jobs**: Used for managing backup jobs for the MySQL server. A backup job (profile) is a configuration file used to store information about what is backed up, where the backup is stored, and optionally when backups will be performed.

Right-clicking on a Backup Job is an alternative way to access the available actions, such as Configure Job, Delete Job, and Execute Backup. Right-clicking also offers two additional options:

- Execute Backup to Image File: Saves the backup to a single file, and prompts for the file name.
- Copy Backup Command to Clipboard: Generates a command for executing the backup, and copies it to your clipboard. You might execute this command in the shell or terminal, which looks similar to: /bin/mysqlbackup --defaults-file="/var/lib/meb/foo.cnf" --show-progress=stdout backup --with-timestamp.
- Backup Job Details: Displays information about the state of a specific (selected) backup job. It includes information from the Settings page, and information specific to the selected backup.
- **Recent Activity**: Historical information about the backup operations performed on the server. View the backup log by right-clicking an entry and choosing View Backup Log

A progress dialog is generated for the backup operation.

### **Backup Jobs**

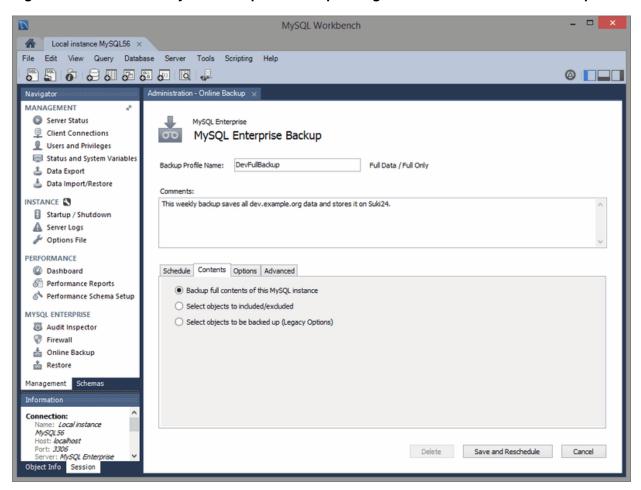

The following information applies to the **New Job** operation, and **Configure Job** is used to modify existing jobs.

The **Backup Profile Name** and its associated **Comments** field are used to identify the backup job's profile, and this name is listed on the main page.

The **New Job** scheduling page separates the configuration information into four tabs. The **Contents** tab defines the schemas and tables to back up, and whether the job is a full or partial backup.

• Full backup: All schemas and tables are backed up (see the figure that follows).

Figure 6.34 Workbench: MySQL Enterprise Backup Configuration: Contents for Full Backups

Partial: Select the schemas and tables (objects) that you want to back up (see the figure that follows).
 Choose Select objects to included/excluded to open the table inclusion (and exclusion) options. For additional information about the include, exclude, and Transportable Tablespace options, see the MySQL Enterprise Backup documentation titled Partial Backup and Restore Options.

Figure 6.35 Workbench: MySQL Enterprise Backup Configuration: Contents for Partial Backups

The **Options** tab includes settings to modify the default behavior of the backup process.

• Backup Storage Directory: By default, the Backup Storage Directory is stored under a sub-folder using the name of the Backup Profile Name in the MySQL Backup Home Directory setting.

A new sub-folder is created for each backup, named with its timestamp. An example subdirectory is "2016-02-22\_17-49-18" where 17:49:18 is the time.

Incremental backups are also stored in the **Backup Storage Directory** directory, but in their own inc/sub-folder. Each incremental backup also creates its own timestamped sub-folder within inc/.

- Compress Backup: Optionally compress non-incremental InnoDB backups.
- Apply Log after backup: After a backup is completed, an apply-log operation is needed before it can be completed. This can be done after a backup, before recovery, or at any other time. Disabled by default.
- **Skip Unused Pages**: Use this option to reduce the backup size by removing unused pages that are typically generated by bulk deletes. Disabled by default.

#### Note

Enabling this increases the restoration time because the removed unused pages must be added back during the recovery process.

Additional options include compression and apply-log, and the option to **Skip Unused Pages**. The following figure shows an example of the **Options** tab.

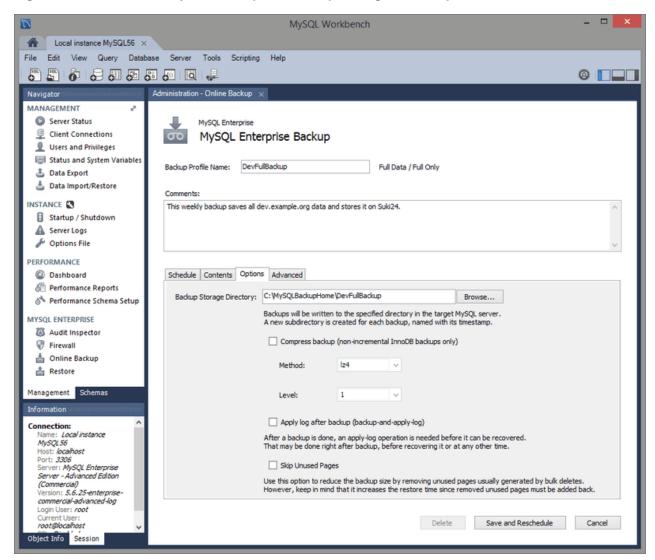

Figure 6.36 Workbench: MySQL Enterprise Backup Configuration: Options

The **Schedule** tab optionally sets a backup schedule for both full and incremental backups (see the figure that follows). The schedule uses the Windows Tasks Scheduler on Microsoft Windows, and a cron job on Linux and macOS. It is scheduled using the operating system user that is scheduling the backup, which is typically the MySQL user.

A full backup is slower than the incremental backup that merges with a full backup. A common scenario is to set a full backup as weekly, and an incremental backup as daily. For additional information about backup performance, see Optimizing Backup Performance.

These additional options are not validated.

To recover backups, see Section 6.7.3, "Backup Recovery".

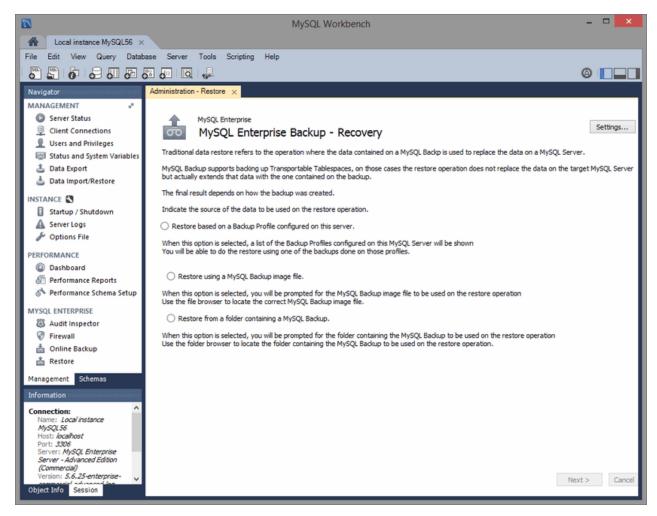

## 6.7.3 Backup Recovery

The Backup Recovery wizard is used to recover MySQL Enterprise Backup backups. For more information about creating MySQL Enterprise Backup backups using MySQL Workbench, see Section 6.7.2, "Online Backup".

The Backup Recovery wizard allows you to restore backups from folders, image files, and backup profiles created by Section 6.7.2, "Online Backup". Before you can restore a MySQL instance from a backup to a target server, you must first delete all files inside the data directory of that server.

Click **Restore** from the Navigator, then choose the appropriate option. The following figure shows an example recovery session.

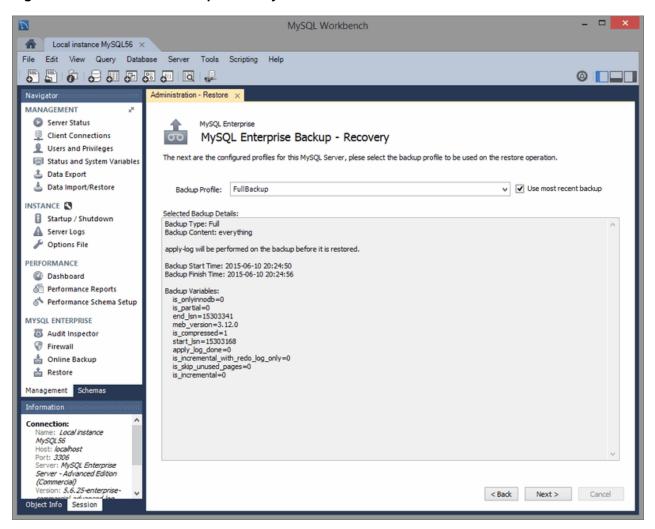

Figure 6.38 Workbench: Backup Recovery: Start

- Backup Profile: Choose from the available MySQL Enterprise Backup profiles on your system.
- Backup Image File: Opens the system's file browser; choose a backup image file to restore.
- Backup Folder: Opens the system's file browser; choose a backup folder to restore.

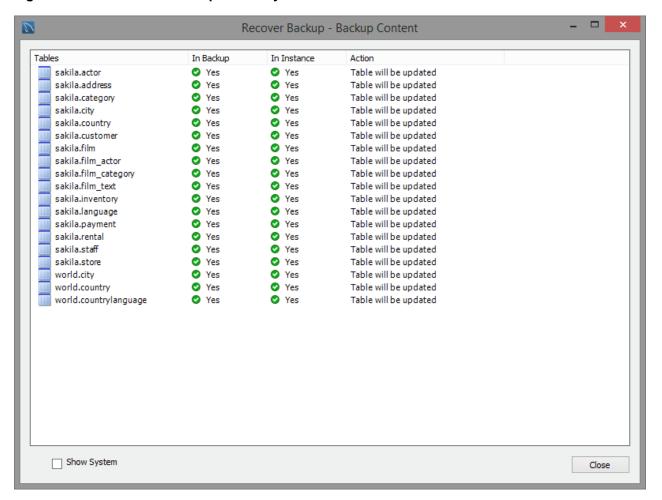

In the following figure, the example session restores a full backup profile that was created by MySQL Workbench Online Backup. After choosing the "FullBackup" profile that we created earlier, use the next page to review its upcoming restoration.

Figure 6.39 Workbench: Backup Recovery: Profile

Optionally, click **View Backup Content** to view the backup contents for the restoration (see the figure that follows for an example).

#### Note

The **Show System** check box toggles internal schemas from view, schemas such as the internal performance\_schema and mysql tables.

Clicking **Next >** will open the **Restore** wizard. The example next uses **Restore >** to execute the restoration process and to toggle the message logs as shown in the following figure.

## 6.8 MySQL Enterprise Firewall Interface

MySQL Workbench provides a graphical interface to MySQL Enterprise Firewall.

#### Note

The MySQL Enterprise Firewall interface was added in MySQL Workbench 6.3.4.

For additional information about MySQL Enterprise Firewall, see <a href="https://dev.mysql.com/doc/en/firewall.html">https://dev.mysql.com/doc/en/firewall.html</a>.

## **Setup and Configuration**

MySQL Workbench can manage the MySQL Enterprise Firewall installation and configuration by installing (or uninstalling) and enabling (or disabling) the plugin as follows:

• **Enable**: Executes SET GLOBAL mysql\_firewall\_mode = ON; against the connected MySQL server. **Disable** sets it to OFF instead of ON.

This is a runtime operation. Configure the MySQL server configuration file to enable MySQL Enterprise Firewall at startup.

• Install: Executes queries to install the new MySQL Enterprise Firewall tables and stored procedure needed to switch the state. Uninstall reverses these effects, which also removes the recorded rules.

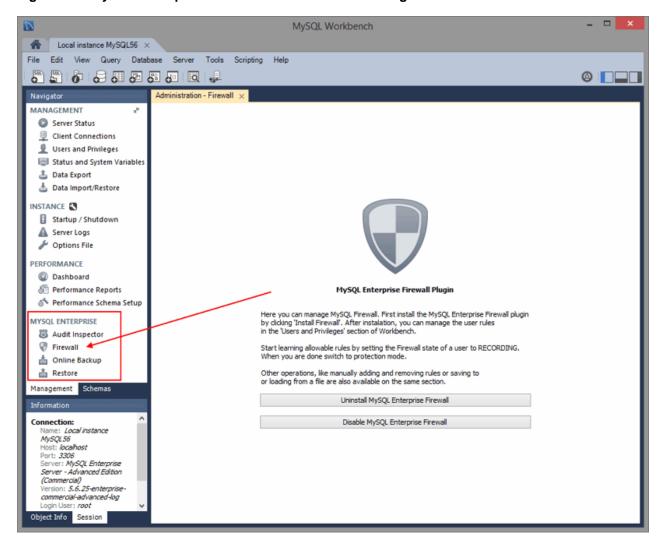

#### **Note**

Alternatively, you can manually install and enable MySQL Enterprise Firewall. For additional information, see Installing or Uninstalling MySQL Enterprise Firewall.

The following figure shows the first step to install and enable MySQL Enterprise Firewall from within MySQL Workbench.

Figure 6.42 MySQL Enterprise Firewall Installation and Configuration

Because clicking **Enable Firewall** from MySQL Workbench is a runtime operation, enabling the mysql\_firewall\_mode option in the configuration option will enable it after a restart (see the figure that follows). You can edit the MySQL configuration file with an external editor or use MySQL Workbench to edit it.

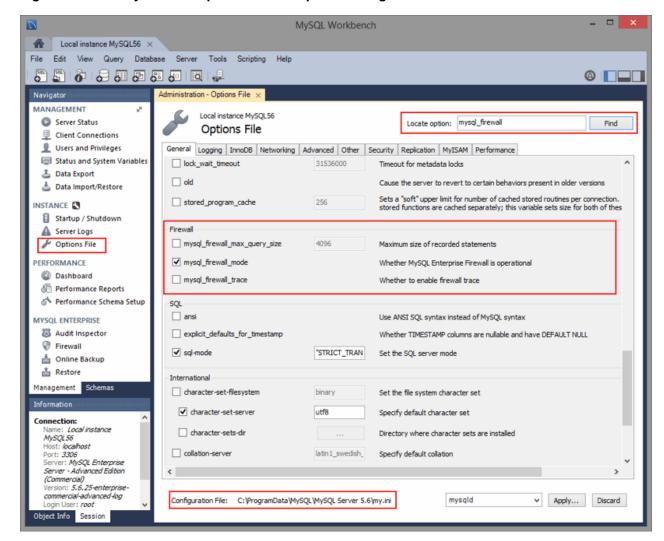

Figure 6.43 Edit MySQL Enterprise Firewall Options Using Workbench

### **Firewall Rules and Information**

The **Firewall Rules** tab lists the active and recorded rules for a given user, the state of each rule, and includes options to add, delete, and save rules. The next figure shows the actions available within the **Firewall Rules** tab.

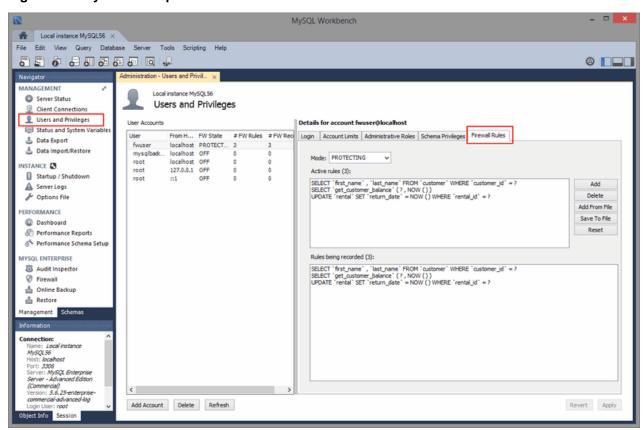

- State (mode): Options include OFF (disables the firewall), PROTECTING (enables the whitelist), RECORDING (training mode), and RESET (removes the rules). For additional information about the meaning of these states, see MySQL Enterprise Firewall Procedures and Functions.
- Administrative actions include Add and Delete for individual rules, and Clear to clear (remove) all rules.
   Add From File prompts for a firewall rules text file (defaults to the .fwr extension) that contains one rule per line, and Save To File saves the current rules.
- Active rules are used in PROTECTIVE mode, and Rules being recorded are entries still being RECORDED. Switching from RECORDING to PROTECTING mode copies the recorded rules into the active rule subset.

#### Note

MySQL Workbench executes queries, gets variables, and performs a lot of checks. For this reason, MySQL Workbench is more useful as an administration tool for MySQL Enterprise Firewall than a tool to record rules. For example, RECORDING rules in MySQL Workbench will record the behind-the-scenes operations performed by MySQL Workbench for the MySQL user. Also, using MySQL Workbench by a MySQL user in PROTECTING mode will attempt to execute operations that a typical firewalled MySQL user might not have access to.

# 6.9 The wbcopytables Tool

wbcopytables is a command line utility included in MySQL Workbench that allows you to copy table data from a supported source database server to MySQL. It is used by the Workbench Migration wizard to copy data after the schema is migrated and created in the target MySQL server.

wbcopytables can connect to the source database using either ODBC, the Python DBAPI, or the native MySQL client library.

The copy executes a SELECT statement on the source database, and then INSERT's the retrieved rows into the target MySQL server.

**Table 6.2 File Location (Default)** 

Operating System	Location
Linux	/usr/bin/wbcopytables

Operating System	Location	
macOS	/Applications/MySQLWorkbench.app/Contents/MacOS/wbcopytables	
Windows	<pre>C:\Program Files (x86)\MySQL\MySQL Workbench 6.3\wbcopytables.exe</pre>	

### **Connection Parameters**

Options for the source connection are:

--odbc-source=ODBC\_connection\_string: The syntax of the ODBC connection string uses standard ODBC syntax. You can also use a ODBC data source name (DSN).

--mysql-source=MySQL\_connection\_string: Use for MySQL sources (when doing a MySQL to MySQL migration/copy). It uses the same syntax as the MySQL Utilities:

- For TCP/IP connections: username[:password]@host:port
- For local socket connections: username[:password]@::socket\_path

You can pass the connection password by using the --source-password option.

For the target connection, the option is: --target=MySQL\_connection\_string.

You can use the --passwords-from-stdin option to pass a passwords through STDIN. Source and target passwords must be separated by a tab character.

You can use ODBC specific data source options from the source RDBMS to specify the number of rows to fetch at a time for the source SELECT statement.

# **Table Specification**

One or more tables can be specified in the command line for the copy operation. There are two copy types:

- Full table copy: --table
- Range copy: --table-range

Both table copy types require a set of common arguments:

- **Source schema**: The schema/catalog the table belongs to. If quoting is required, it must be done using the syntax from the source RDBMS. For example, SQL Server uses [square\_brackets].
- **Source table**: The table to copy. If the source RDBMS uses a schema name in addition to a catalog, both schema and table must be specified here and separated by a dot. For example, [dbo].[mytable].
- Target schema: The name of the MySQL schema. If quoting is needed, it must use the MySQL backtick syntax. For example, `sakila`.
- Target table: The name of the MySQL table.
- Select expression: The list of fields to SELECT. This will be inserted verbatim into the source SELECT statement.

#### Caution

Use caution as this expression is copied directly into the source  ${\tt SELECT}$  statement.

For the select expression, if both the source and target tables have the same fields in the same order, and use compatible types, you can simply pass \* here, which will build a query like "SELECT \* FROM [dbo]. [mytable]". If not, you can specify the fields as you would in the SELECT statement, which are comma (,) separated and with proper escaping/quoting specific to the source RDBMS. You can also specify typecasts and/or data conversions that the source RDBMS supports. For example:

[client\_id], [name], [address], AsText([location])

Because each option must be interpreted as a single option by the wbcopytables command, you must perform OS shell specific quoting whenever necessary. Usually, quoting your parameter values with 'single' or "double" quotes is enough. This is in addition to any database specific quoting you use.

### **Full Table Copy**

This performs a full SELECT on the source table, fetches records, and then inserts them into the target table.

There are no additional arguments required.

The --table syntax is as follows:

```
--table Source_Schema Source_Table Target_Schema Target_Table Select_Expression
```

### Range Copy

This performs a SELECT copy on the source table for the specified range. The table must have a numeric UNIQUE NOT NULL or PRIMARY KEY that is used to create a WHERE expression for the range.

The --table-range syntax is as follows:

```
--table-range Source_Schema Source_Table Target_Schema Target_Table Select_Expression Source_Key Range_Sta
```

The generated expression is:

```
key_column >= range_start AND key_column <= range_end
```

If you specify -1 for Range\_End, then the expression will be:

```
key_column >= range_start
```

# **Other Options**

- --thread-count=Number: If you are copying more than one table, you can use this option to divide the tables across several threads. There is no support for dividing a single table across many threads.
- --count-only: Only perform a COUNT(\*) of the SELECT which would be generated by the --table option that was used. The target schema and table can be omitted in this case.

• --truncate-target: Execute a TRUNCATE TABLE command on each target table that is copied.

# **Trigger Handling**

Because there is no way to temporarily disable triggers in MySQL and they can affect the copy process, MySQL Workbench will backup and drop all triggers from the target MySQL database before the copy process starts, and then these triggers are restored after the copy finishes. The triggers are backed up in the target schema under a table named wb\_tmp\_triggers.

- --disable-triggers-on=Schema\_Name: Performs the backup and DROP process for all triggers in the specified schema.
- --reenable-triggers-on=Schema\_Name: Restores triggers previously backed up to the wb\_tmp\_triggers table.
- --dont-disable-triggers: Bypass the trigger disabling step.

# 7.1 Performance Dashboard

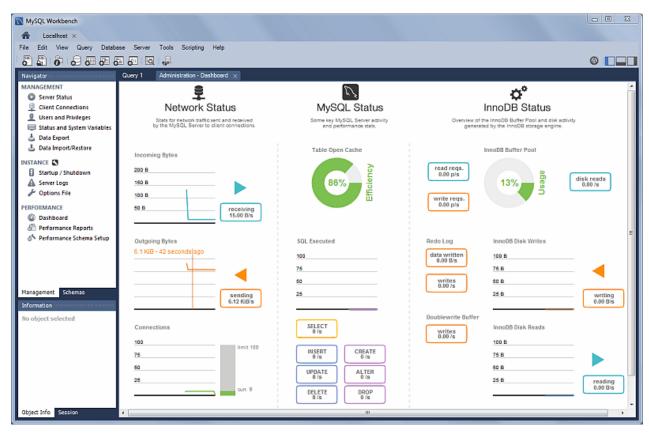

View server performance statistics in a graphical dashboard. To display the dashboard, open a query tab and then click **Dashboard** from the Performance area of the Navigator sidebar with the **Management** tab selected. The following figure shows the layout of the information within the **Administration - Dashboard** tab.

### **Note**

This feature requires MySQL Server 5.6 or higher.

Figure 7.1 Performance: Dashboard

### **Network Status**

This highlights statistics for network traffic sent and received by the MySQL server over client connections. Data points include the **Incoming Network Traffic**, **Outgoing Network Traffic**, and **Client Connections**.

### **MySQL Status**

This highlights the primary MySQL server activity and performance statistics. Data points include the **Table Open Cache** efficiency, **SQL Statements Executed**, and counts (per second) for SELECT, INSERT, UPDATE, DELETE, CREATE, ALTER, and DROP statements.

### **InnoDB Status**

This provides an overview of the InnoDB Buffer Pool and disk activity that is generated by the InnoDB storage engine. Data points are separated into three groups:

#### Note

Hover over a graph to see additional information, such as a total count.

### Usage

- Read Requests: The number of logical read requests (per second) InnoDB has performed to the buffer pool.
- Write Requests: The number of logical write requests (per second) InnoDB has performed to the buffer pool.
- Disk Reads: The number of logical reads that InnoDB could not satisfy from the buffer pool. As a result, these had to be read from the disk.
- InnoDB Buffer Pool Usage: The percentage of the InnoDB buffer pool that is in use. Hover over the graphic to see additional information, such as Usage Rate and Pages Free.

#### Writes

- Data Written: The number of writes written to the InnoDB redo log file.
- Writes: The number of physical writes written to the InnoDB redo log file.
- InnoDB Disk Writes: Hover over this dynamic graph to see the number of disk writes over a specific second. The available range includes the last 120 seconds.
- Writing: Total amount of data (in bytes) written using file operations by the InnoDB storage engine.

### Reads

- Doublewrite Buffer Writes: The number of doublewrite operations that were performed.
- InnoDB Disk Reads: Hover over this dynamic graph to see the number of disk reads over a specific second. The available range includes the last 120 seconds.
- Reading: Total amount of data (in bytes) read in file operations by the InnoDB storage engine.

# 7.2 Performance Schema Reports

Performance schema based reports provide insight into the MySQL server operations through helpful high-level reports. MySQL Workbench uses the **SYS** views on the Performance Schema to generate over 20 reports to help analyze the performance of your MySQL databases. Reports help analyze IO hotspots, discover high cost SQL statements, and review wait statistics and InnoDB engine metrics. For additional information about the SYS schema, see MySQL sys Schema.

#### Note

This feature requires MySQL Server 5.6 or higher.

### **Installation and Configuration**

A GUI for configuring and fine tuning the Performance Schema instrumentation (see the figure that follows). Initially, this loads an **Easy Setup** tab that is enough for most users. To enable all available Performance Schema instruments, pause your pointer device over **Fully Enabled** and click the circle on the slide bar.

The SYS schema is bundled with MySQL Server 5.7 and above, and MySQL Workbench uses that version. However, for MySQL Server 5.6, Workbench installs its own bundled version of the SYS schema.

#### Note

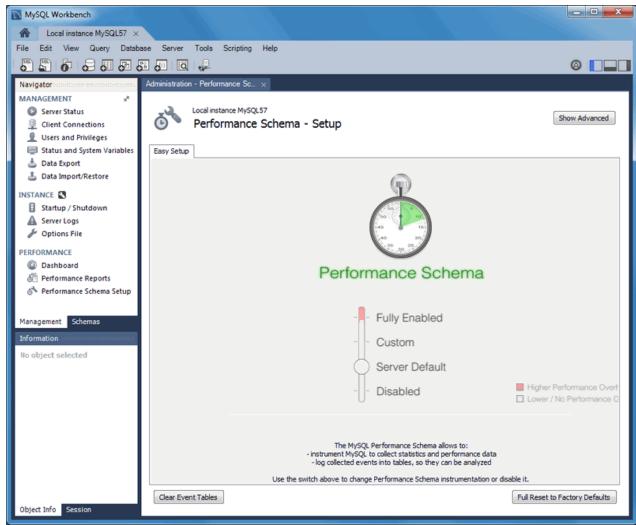

This feature requires MySQL Server 5.6 or higher.

### Note

The size of the saved digested query is determined by the MySQL server.

Figure 7.2 Performance Schema Setup: Easy Setup

Clicking **Show Advanced** provides methods to fine tune the Performance Schema instrumentation. The next figure shows the tabs related to advanced instrumentation and the **Introduction** tab selected.

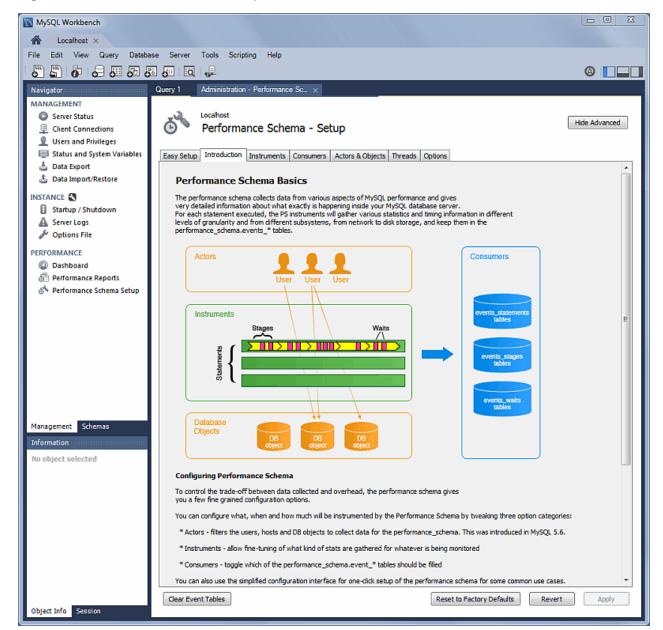

Figure 7.3 Performance Schema Setup: Introduction

# **Performance Report Controls**

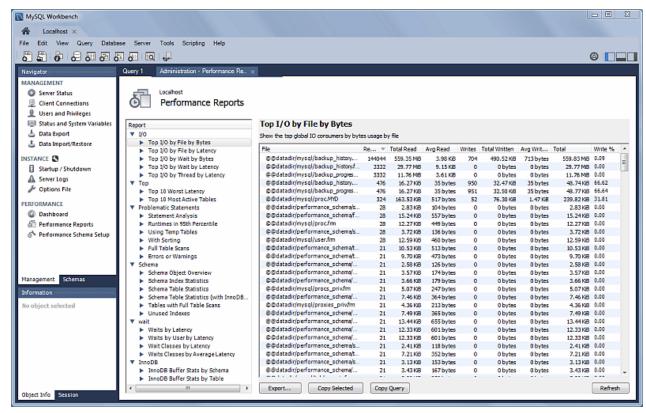

Performance report data can be viewed and exported using the following controls (see the figure that follows):

- Export: Export all entries and associated data (and column headings) from the current performance report, which includes all queries and values. Opens a file dialog for export.
- **Copy Selected**: Copies a single entry and associated data (and column headings) from the current performance report. Saves to the system's clipboard. An example:
- Copy Query: Copies the SQL query that generated the performance report. Saves to the system clipboard.

• Refresh: Refreshes (reloads) the performance report.

### **Performance Report Descriptions**

Figure 7.4 Performance Reports: Top I/0 By Bytes

The available performance reports include (this is a non-exhaustive list):

- Top File I/O Activity Report. Show the files performing the most IOs (in bytes)
- Top I/O by File by Time: Show the highest IO usage by file and latency
- Top I/O by Event Category: Show the highest IO Data usage by event categories
- Top I/O in Time by Event Categories: Show the highest IO time consumers by event categories
- Top I/O Time by User/Thread: Show the top IO time consumers by user/thread
- Statement Analysis: Lists statements with aggregated statistics
- Statements in Highest 5 Percent by Runtime: Lists the top 5% statements with the highest runtime (in microseconds),
- Using Temp Tables: Lists all statements that use temporary tables -- accesses the highest number of disk temporary tables, then memory temp tables
- With Sorting: List all normalized statements that have done sorts, and accesses them in the following priority order -- sort\_merge\_passes, sort\_scans, then sort\_rows
- Full Table Scans: Lists statements that performed a full table scan. Accesses query performance and the where clause(s), and if no index is used then it recommends adding indexes for large tables

- Errors or Warnings: Lists statements that have raised errors or warnings
- · Schema Object Overview (High Overhead): Shows counts by object type for each schema

#### Note

This can take a long time to execute on instances with a large number of objects.

- Schema Index Statistics
- Schema Table Statistics
- Schema Table Statistics (with InnoDB buffer)
- Tables with Full Table Scans: Finds tables that are being accessed by full table scans, ordering them by the number of rows scanned (DESC)
- Unused Indexes: List of indexes that were never used since the server started or since P\_S data collection started
- Waits by Time: Lists the top wait events by their total time, ignoring idle (this often contain large values)
- Waits by User by Time: Lists the top wait events by their total time, ignoring idle (this often contain large values)
- Wait Classes by Time: Lists the top wait classes by total time, ignoring idle (this often contain large values)
- Waits Classes by Average Time: Lists the top wait classes by average time, ignoring idle (this often contain large values)
- InnoDB Buffer Stats by Schema: Summarizes the output of the INFORMATION\_SCHEMA.INNODB\_BUFFER\_PAGE table, aggregating it by schema
- InnoDB Buffer Stats by Table: Summarizes the output of the INFORMATION\_SCHEMA.INNODB\_BUFFER\_PAGE table, aggregating it by schema and table name

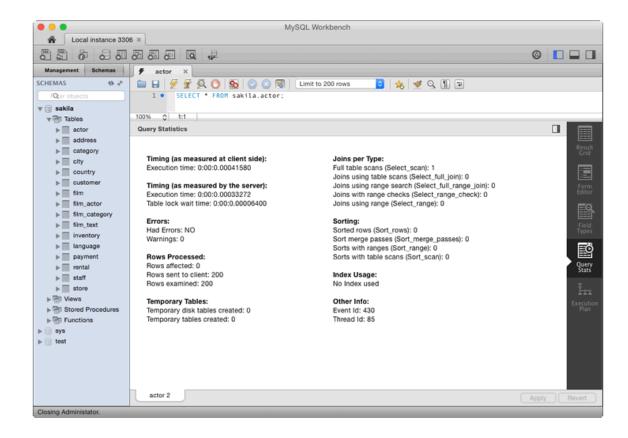

# 7.3 Query Statistics

The **Query Stats** SQL editor results tab (see the next two figures) uses Performance Schema data to gather key statistics collected for executed query, such as timing, temporary tables, indexes, joins, and more.

# Requirements

- MySQL server 5.6 or higher.
- Query, Collect Performance Schema Stats enabled.
- The performance\_schema enabled with statement instrumentation.

# 7.4 Visual Explain Plan

The **Visual Explain** feature generates and displays a visual representation of the MySQL EXPLAIN statement by using extended information available in the extended JSON format.

### Note

The extended EXPLAIN format is available as of MySQL server 5.6.5.

MySQL Workbench provides all of the EXPLAIN formats for executed queries including the raw extended JSON, traditional format, and visual query plan.

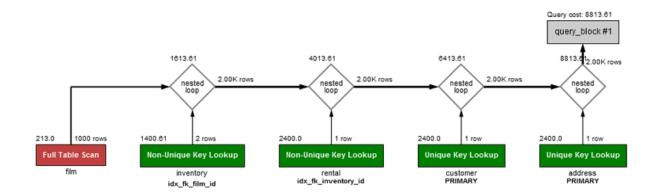

## **Visual Explain Conventions**

The next figure shows the visual representation of the following query:

```
SELECT CONCAT(customer.last_name, ', ', customer.first_name) AS customer, address.phone, film.title FROM rental INNER JOIN customer ON rental.customer_id = customer.customer_id
```

```
INNER JOIN address ON customer.address_id = address.address_id
INNER JOIN inventory ON rental.inventory_id = inventory.inventory_id
INNER JOIN film ON inventory.film_id = film.film_id
WHERE rental.return_date IS NULL
AND rental_date + INTERVAL film.rental_duration DAY < CURRENT_DATE()
LIMIT 5;</pre>
```

Figure 7.7 A Visual Explain Example

The order of execution is bottom to top, and left to right.

### **Graphic Conventions**

· Standard Boxes: tables

Rounded boxes: operations such as GROUP and SORT

• Framed boxes: subqueries

· Diamonds: joins

### **Textual Conventions**

- Standard text below boxes: table (or alias) name
- Bold text below boxes: key/index that was used
- · Number in top right of a box: number of rows used from the table after filtering
- Number in top left of a box: relative cost of accessing that table (requires MySQL 5.7 or greater)
- Number to the right of nested loop diamonds: number of rows produced by the JOIN
- Number above the loop diamonds: relative cost of the JOIN (requires MySQL 5.7 or greater)

The associated colors and descriptions used in the Visual Explain diagram:

**Table 7.1 Visual Explain Diagram Information** 

System Name			Tooltip related information	
SYSTEM	Blue	Single row: system constant	Very low cost	

System Name	Color	Text on Visual Diagram	Tooltip related information	
CONST	Blue	Single row: constant	Very low cost	
EQ_REF	REF Green Unique Key Lookup		Low cost The optimizer is able to find an index that it can use to retrieve the required records. It is fast because the index search directly leads to the page with all the row data	
REF	Green	Non-Unique Key Lookup	Low-medium Low if the number of matching rows is small; higher as the number of rows increases	
FULLTEX	TYellow	Fulltext Index Search	Specialized FULLTEXT search. Low for this specialized search requirement	
REF_OR_	Mode	Key Lookup + Fetch NULL Values	Low-medium if the number of matching rows is small; higher as the number of rows increases	
INDEX_M	EER GET	Index Merge	Medium look for a better index selection in the query to improve performance	
UNIQUE_	SOU BROOMER	ป่กique Key Lookup into table of subquery	Low Used for efficient Subquery processing	
INDEX_S	<b>UB</b> iQbyERY	Non-Unique Key Lookup into table of subquery	Low Used for efficient Subquery processing	
RANGE	Orange	Index Range Scan	Medium partial index scan	
INDEX	Red	Full Index Scan	High especially for large indexes	
ALL	Red	Full Table Scan	Very High very costly for large tables, but less of an impact for small ones. No usable indexes were found for the table, which forces the optimizer to search every row. This could also mean that the search range is so broad that the index would be useless.	
UNKNOW	/NBlack	unknown	Note: This is the default, in case a match cannot be determined	

# Visual Explain Usage

To view a visual explain execution plan, execute your query from the SQL editor and then choose the **Execution Plan** tab in the query results tab. The execution plan defaults to "Visual Explain" but also has a "Tabular Explain" view that is similar to what you would see when executing EXPLAIN in the MySQL client.

# 7.5 Tutorial: Using Visual Explain to Improve Query Performance

In this example, Visual Explain helps locate and fix problematic (slow) queries. This tutorial uses the DBT-3 database, and begins with the following query:

```
SELECT * FROM orders
WHERE YEAR(o_orderdate) = 1992 AND MONTH(o_orderdate) = 4
```

```
AND o_clerk LIKE '%0223';
```

In the screenshot below, we executed this query and generated a Visual Explain report by selecting **Query**, **Visual Explain Current Statement** from the main menu.

Figure 7.8 DBT-3 Visual Explain Tutorial: Full Table Scan

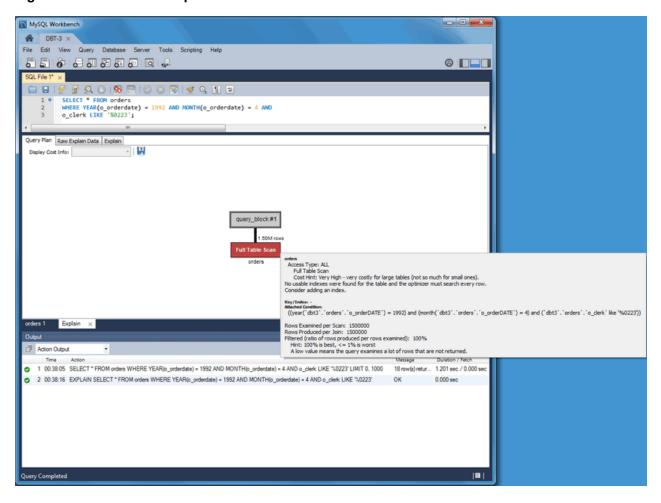

Figure 7.9 DBT-3 Visual Explain Tutorial: Full Table Scan: Traditional View

Notice that ...

Why did this query generate a full table scan? Why is our indexed o\_orderdate column missing as a possible key? Looking more closely, we notice that our indexed column is being used in an expression as "WHERE YEAR(o\_orderdate) = 1992 AND MONTH(o\_orderdate) = 4", so its index is not used. To use the existing index we can adjust the query like so:

```
SELECT * FROM orders

WHERE o_orderdate BETWEEN '1992-04-01' AND '1992-04-30'

AND o_clerk LIKE '%0223';
```

Query Completed

|B|

Notice the differences. The Type changed from ALL to range, possible keys (and used key) changed from NULL to i\_o\_orderdate, and the number of scanned rows changed from 1.5 million to about 33 thousand. Still, scanning 33 thousand rows while returning just 18 is unnecessary, so we focus on the o\_clerk column. An index here should improve performance: so:

CREATE INDEX i\_o\_clerk ON orders(o\_clerk);

Figure 7.12 DBT-3 Visual Explain Tutorial: Index Range Scan: Traditional View, After Index

Notice that our new index is not being considered as a possible key. This is because we are searching the suffix of the o\_clerk column, and indexes do not work with suffixes (although they do work with prefixes). In our simple case, we were being lazy and could have simply used the entire clerk ID. Adjusting the query shows better results:

```
SELECT * FROM orders
WHERE o_orderdate BETWEEN '1992-04-01' AND '1992-04-30'
AND o_clerk LIKE 'Clerk#000000223';
```

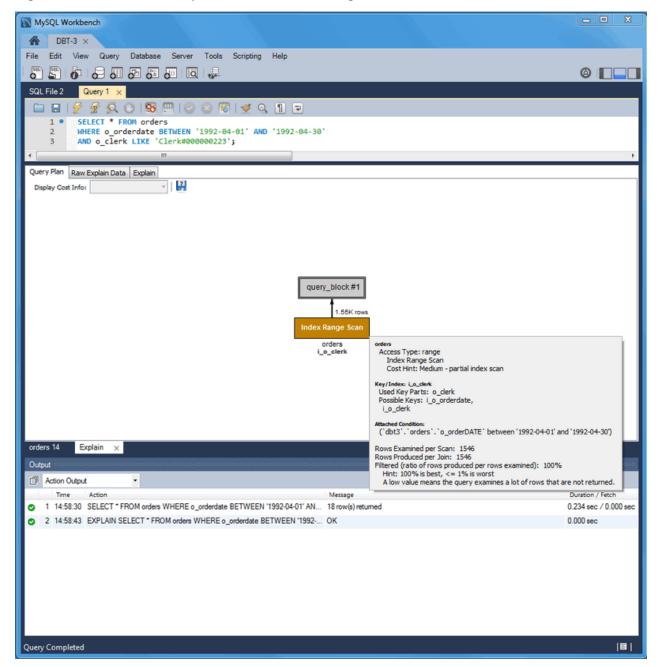

Figure 7.13 DBT-3 Visual Explain Tutorial: Index Range Scan: Better

Figure 7.14 DBT-3 Visual Explain Tutorial: Index Range Scan: Better (Traditional)

The new o\_clerk index was considered and used, and our query scanned 1546 rows instead of 32642, and the query execution improved from 0.281 to 0.234 seconds. However, EXPLAIN estimates that this query scans 1546 rows to return 18. After reviewing our query, notice that a multi-column index can meet the conditions of our WHERE clause that is based on both the o orderdate and o clerk columns:

CREATE INDEX io\_clerk\_date ON orders(o\_clerk, o\_orderdate)

### Note

We listed o\_clerk as the first column in our index because o\_orderdate uses a range. ...

Now, executing the same query shows even better results. An estimated 18 rows are both scanned and returned, and the execution time of our query is 0.234 seconds.

# 8.1 Visual SQL Editor

The visual SQL Editor lets you build, edit and run queries, create and edit data, and view and export results. Color syntax highlighting, context sensitive help and auto-complete helps write and debug SQL statements. The integrated EXPLAIN plans provide data to help optimize the your queries. The following figure shows the main elements of the visual editor.

Figure 8.1 SQL Editor GUI

The following sections describe how to use the visual SQL editor.

# 8.1.1 SQL Query Window

In this area, you can enter SQL statements directly. The statements entered can be saved to a file or snippet for later use. At any point, you can also execute the statements you have entered.

To save a snippet of code entered into the SQL Query panel, click the Save SQL to Snippets List icon in the **Snippets** panel, enter a name (optional), and click **OK**. The snippet can be inserted into the SQL Query panel at any time by double-clicking the snippet in the SQL Snippets panel. The following figure shows the main elements of a query window.

Figure 8.2 SQL Editor - SQL Query Panel

Executing a SELECT query will display the associated result set in the SQL View panel, directly below the SQL Query panel. These cells are editable if MySQL Workbench is able to determine how, as for example they are editable if a Primary or Unique key exists within the result set. If not, MySQL Workbench will display a "read-only" icon at the bottom-right corner of the SQL View panel, and hovering the mouse cursor over this icon will provide a hint as to why it's not editable.

### Note

To quickly enter the name of a table, view, or column, double-click the item in the Schemata Palette. The item name will be inserted into the SQL Query panel.

The SQL Editor has several configurable panels and windows, as described in the screenshot above.

# 8.1.2 SQL Query Window Toolbar

The toolbar provides buttons in two locations: one in the main toolbar and one within the SQL Editor itself. The following figure shows the SQL Editor buttons.

Figure 8.3 SQL Editor - Toolbar

SQL query buttons (from left to right) include:

- Open a Script File in this Editor: Loads content from a saved SQL script into the SQL editor.
- Save SQL Script to File: Saves contents from the SQL editor into a file.
- Execute SQL Script: Executes the selected portion of the query, or the entire query if nothing is selected.
- Execute Current SQL script: Execute the statement under the keyboard cursor.
- Explain (All or Selection): Execute the EXPLAIN command on the query under the keyboard cursor.

A "Results Grid" tab is also displayed when executing an EXPLAIN statement. Clicking it will execute the same query, as if **Execute SQL Script** was selected.

Alternatively, the Visual Explain plan is already available for all executed queries. Select **Execution Plan** from the results tab to view it.

Stop the query being executed: Halts execution of the currently executing SQL script.

#### Note

The database connection will not be restarted, and open transactions will remain open.

• Toggle whether execution of SQL script should continue after failed statements: If the red "breakpoint" circle is displayed, the script terminates on a statement that fails. If you click the button so that the green arrow is displayed, execution continues past the failed code, possibly generating additional result sets. In either case, any error generated from attempting to execute the faulty statement is recorded in the Output tab sheet.

This behavior can also be set from the **SQL Execution** user preferences panel.

• Commit: Commits the current transaction.

#### Note

All query tabs in the same connection share the same transactions. To have independent transactions, a new connection must be opened.

• Rollback: Rolls back the current transaction.

#### Note

All query tabs in the same connection share the same transactions. To have independent transactions, a new connection must be opened.

Toggle Auto-Commit Mode: If selected, each statement will be committed independently.

#### Note

All query tabs in the same connection share the same transactions. To have independent transactions, a new connection must be opened.

Auto-commit is enabled by default, and this default behavior can be modified (disabled) under the **SQL Execution** user preferences panel.

• Set Limit for Executed Queries: The default value is 1000, which appends "LIMIT 0, 1000" to SELECT queries.

The default (1000) can be changed from the **SQL Execution** user preferences panel.

- Save Snippet: Save the current statement or selection to the active snippet list.
- Beautify SQL: Beautify/reformat the SQL script.

By default, SQL keywords are changed to UPPER CASE. This functionality can be changed from the **SQL Editor** user preferences panel.

- Find panel: Show the Find panel for the editor.
- Invisible characters: Toggle display of invisible characters, such as newlines, tabs, spaces.

A new line is represented as [LF], a space as a single dot (.), and a tab as a right arrow.

• Wrapping: Toggles the wrapping of long lines in the SQL editor window.

### 8.1.3 Query and Edit Menus

When an SQL Editor tab is selected, the most important items on the main menu bar are the **Query** and **Edit** menus.

### **SQL Query Menu**

The **Query** menu features the following items:

- Execute (All or Selection): Executes all statements in the SQL Query area, or only the selected statements.
- Execute (All or Selection) to Text: Executes all statements in the SQL Query area, or only the selected statements, and displays it in plain text like the standard MySQL command line console.
- Execute Current Statement: Executes the current SQL statement.
- Execute Current Statement (Vertical Text Output): Executes all statements in the SQL Query area, or only the selected statements, and displays it in plain text like the MySQL command line console does vertically (\G).
- Explain Current Statement: Describes the current statement by using the MySQL EXPLAIN statement.
- Visual Explain Current Statement: Visually describes the current statement, based on EXPLAIN information provided by MySQL Server 5.6 and above. MySQL Workbench parses the EXPLAIN (JSON) output from MySQL server 5.6+, and outputs a visual representation.

For additional information about Visual Explain, see Section 7.4, "Visual Explain Plan" and Section 7.5, "Tutorial: Using Visual Explain to Improve Query Performance".

- Stop: Stops executing the currently running script.
- Stop Script Execution On Errors: If enabled, MySQL Workbench stops executing the a query if errors are found. It can be enabled/disabled from this menu.

- Limit Rows: By default, the number of returned rows (LIMIT) is 1000. Values defined here affects subsequent statements. The number ranges from 10 to 50000, and "Don't Limit".
- Collect Performance Schema Stats: Provides data to the Query Stats result set view, which includes statement specific information about Timing, Rows processed, Temporary tables, Joins per type, Sorting, and Index usage.
- Collect Resultset Field Metadata: Provides data to the Form Editor and Field Types result set views.
- Reconnect to Server: Reconnects to the MySQL server.
- New Tab to Current Server: Creates a duplicate of the current SQL Editor tab.
- Auto-Commit Transactions: Enable to auto-commit transactions.
- Commit Transaction: Commits a database transaction.
- Rollback Transaction: Rolls back a database transaction.
- Commit Result Edits: Commits any changes you have made to the server.
- Discard Result Edits: Discards any changes you have made.
- Export Results: Exports result sets to a file. Selecting this option displays the Export Query Results to File dialog. The dialog enables you to select which result set you wish to export, the file format (CSV, HTML, XML), and the name and location of the output file. Then click Export to export the data.

### **Edit Menu**

The **Edit** menu features the **Format** submenu. The **Format** submenu includes the following menu items:

- Beautify Query: Reformats the guery selected in the guery tab and lays it out in nicely indented fashion.
- UPCASE Keywords: Converts keywords to uppercase in the currently selected query in the query tab.
- lowercase Keywords: Converts keywords to lowercase in the currently selected query in the query tab.
- **Un/Comment Selection**: Comments the lines currently selected in the query tab. If the lines are already commented, this operation removes the comments.
- Auto-complete: Triggers the auto-completion wizard. This is enabled (and triggered) by default, and can be disabled with **Preferences**, **SQL Editor**, **Automatically Start Code Completion**. Auto-completion will list functions, keywords, schema names, table names and column names.

### 8.1.4 Results Window

The results area of the screen shows the results from executed statements. If the script contains multiple statements, a result tab will be generated for each statemented that returned results. The following figure shows a single tab and highlights the main actions of the result grid navigation panel.

#### Note

MySQL Workbench handles quoting and escaping for strings entered into the results grid, so adding quotes and proper escaping here is optional.

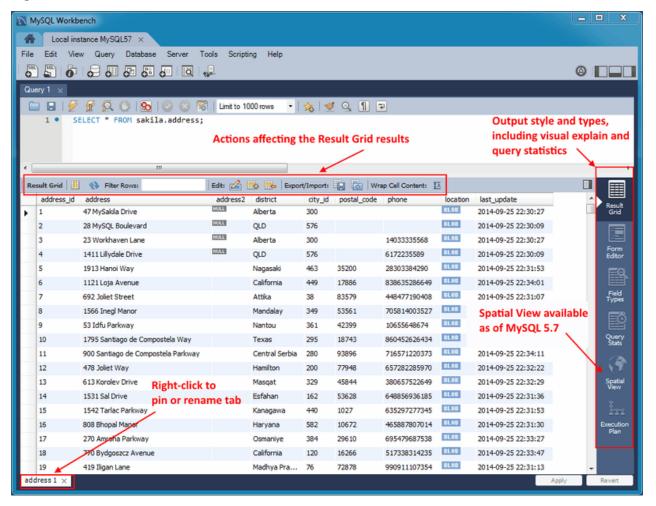

#### Note

It is possible to enter a function, or other expression, into a field. Use the prefix \func to prevent MySQL Workbench from escaping quotation marks. For example,

for the expression md5('fred'), MySQL Workbench normally would generate the code md5('fred'). To prevent this, enter the expression as  $\func md5('fred')$  to ensure that the quoting is not escaped.

Figure 8.4 SQL Editor - Result Grid

Elements of the result grid navigation panel include:

- Reset: Resets all sorted columns.
- Refresh: Refreshes all data by re-executing the original statement.
- Filter Rows: performs a case-insensitive search of all cells. It automatically refreshes, and there is also the refresh button to perform this action manually.
- Edit Current Row: Edit the current row.
- Add New Row: Adds a new empty row, and highlights it in edit mode. Click Apply to execute (and review) the insert row guery.
- Delete Selected Rows: Deletes the selected rows. Click Apply to execute (and review) the delete
  query.
- Export: Writes a result set to a CSV, HTML, JSON, SQL INSERT, Excel, XML, or Tab separated file as required.

#### Note

This exports a result set. To export an entire table or schema, see Data Export.

- Import: Import records from an external CSV file.
- Wrap Cell Content: If the contents of a cell exceeds the cell width, then the data will be cut off with an ellipses. This option will instead wrap the contents within the cell, and adjust the cell height accordingly.

#### Note

The "Refresh" button automatically adjusts the column width to match the longest string one of its cells. You may also manually adjust the column width.

Right-clicking on a results grid tab opens the context-menu, which appears in the figure that follows.

Figure 8.5 SQL Editor - Result Grid Context Menu

The result grid context menu includes:

- Rename Tab: Customize the name (title) of this tab.
- Pin Tab: Pin the results tab to the results grid. Executing additional SQL statements will create new result grid tabs.
- Close Tab: Close this tab.
- Close Other Tabs: Close all tabs except this one.

Right-clicking on a results grid field opens the context-menu, which appears in the figure that follows.

- Delete Row(s): Deletes the entire row.
- Load Value from File: Opens a file dialog to insert a value from a file. The entire file contents are inserted into the field.
- Save Value to File: Saves a field's value to a file.
- Copy Row: Copy the row in escaped CSV format, in a form such as: 'a', 'b','c'. Alternatively, there is Copy Row (tab separated) to use tabs instead of commas as the separator, and Copy Row (unquoted) to not escape the values.
- Copy Row (with names): Copy an escaped row like "Copy Row", but also adds a #comment containing column names. Alternatively, there is Copy Row (with names, unquoted).
- Copy Field: Copies the field name, such as: 'a', or use Copy Field (unquoted) to not use single quotes.
- Paste Row: Pastes the row over the currently selected row.
- Capitalize Text: Capitalizes text in the current row, such as: Hello World.
- lowercase Text: Lowercases text in the current row, such as: hello world.

• UPPERCASE Text: Alters row to use all capitals, such as: HELLO WORLD.

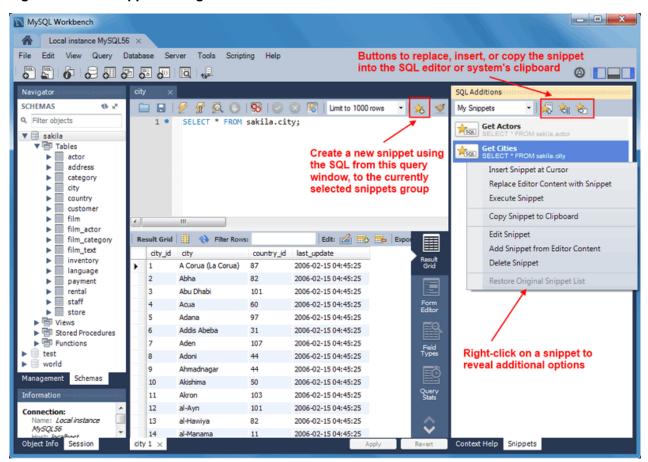

### 8.1.5 SQL Snippets Tab

The Snippets tab includes built-in, local, and shared custom snippets. The **My Snippets** tab stores custom snippets in a file under the MySQL Workbench user's configuration directory. Select the **Shared** option for shared snippets.

### **Using Snippets**

Snippets can be inserted into the SQL editor or the system's clipboard. To insert (use) a snippet, either use the snippet icons or right-click on the desired snippet and choose Insert. The next figure shows the location of the main action icons to use with snippets.

Figure 8.7 SQL Snippets: Usage

### **Local Snippets (My Snippets)**

Local snippets are stored in the MySQL Workbench directory. By default, the "My Snippets" SQL snippets are stored here:

**Table 8.1 Default Local Snippet File Location** 

Operating System File Path	
Windows	%AppData%\MySQL\Workbench\User Snippets.txt

Operating System	File Path	
macOS	~username/Library/Application Support/MySQL/Workbench/snippets/L Snippets.txt	
Linux	~username/.mysql/workbench/snippets/User Snippets.txt	

Editing (or adding) snippets to "My Snippets" in MySQL Workbench edits this plain text file. Optionally, you can edit this file outside of MySQL Workbench or create new files that will also be listed under the snippets selector. For example, adding a file named "More Snippets.txt" will add a "More Snippets" section to the snippets selection box.

### **Shared Snippets**

**Shared** snippets are saved in a .mysqlworkbench schema on the connected MySQL server. Selecting "Shared" for the first time will request permission for MySQL Workbench to create this shared .mysqlworkbench schema. Users connected to this MySQL server are allowed to create, edit, and use these shared snippets.

#### Note

Shared snippets were added in MySQL Workbench 6.2.0.

The .mysqlworkbench schema is hidden from within MySQL Workbench as it is considered an internal schema that does not need to be seen or edited.

### **Built-in Snippets**

Several built-in SQL snippets are bundled with MySQL Workbench, and typically show the SQL syntax for MySQL operations. They are divided up into the following categories.

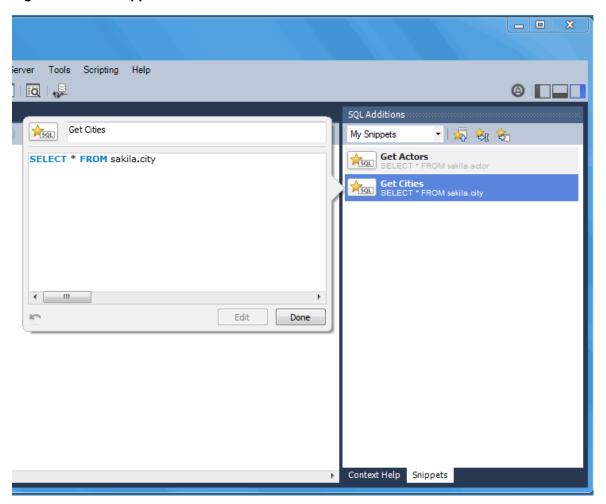

- **DB Mgmt** (Database Management): Syntax examples use SHOW in many forms to provide information about databases, tables, columns, or status information about the MySQL server.
- **SQL DDL** (SQL Data Definition Language): Syntax examples include creating, altering, and dropping tables, indexes, views, and procedures.
- SQL DML (SQL Data Manipulation Language): Syntax examples for operations such as SELECT, INSERT, and REPLACE.

The built-in operations are stored in text files in the same directory as the custom snippet files.

### Saving and Editing Snippets

To save a snippet, choose the Snippets Insert icon ( ) or right-click in the snippet window and choose **Add Snippet from Editor Content** from the context-menu. Double-click a snippet to open it, and choose the snippet editor to edit its body or title. The example in the following figure shows two snippets with only the first having defined a name.

Figure 8.8 SQL Snippets: Editor

# 8.1.6 Context Sensitive Help

Select a keyword or function in your query, and after a delay, it shows formatted help information from the MySQL Server (equivalent to using the help command from the command-line MySQL Client). The next figure shows the location of the context-sensitive options.

### Note

This queries the MySQL Server for the help text, so it can be slow over a slow network

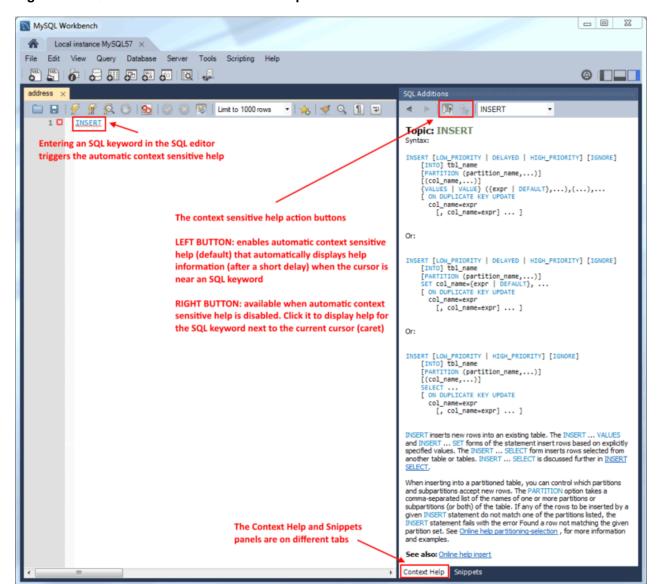

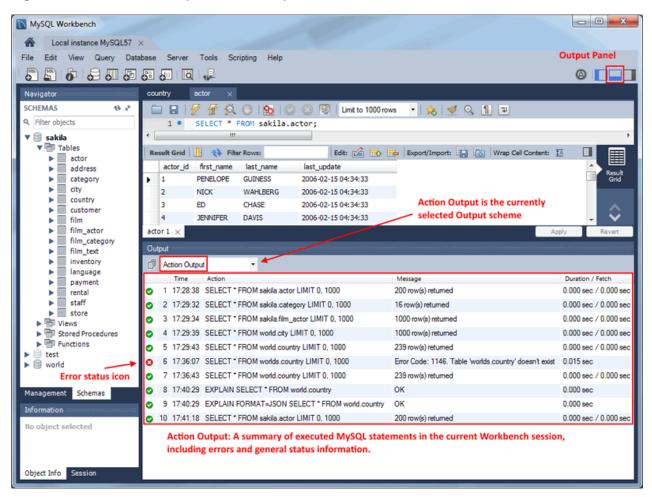

Figure 8.9 SQL Editor: Context Sensitive Help

# 8.1.7 Output History Panel

The **Output** is located at the bottom of MySQL Workbench. Its select box includes the Action Output, History Output, and Text Output options.

The **Action Output** panel displays a summary of the communication between the active MySQL connection in MySQL Workbench and the MySQL server, and can refer to errors or general information. Each message displays the time, action, and server response. The following figure shows this output, which can be useful to troubleshoot a script.

Figure 8.10 SQL Editor: Output: Action Output

The **History Output** panel provides a history of SQL operations carried out in MySQL Workbench for the active MySQL connection. The time and SQL code for each operation is recorded. To view the executed SQL statement, click the time, and the SQL code executed will be displayed in the **SQL** column, as the following figure shows.

# 8.1.8 Table Data Search Panel

Find data across a MySQL connection by using the text search feature on any number of tables and schemas.

From the Schema Tree, choose the tables and/or schemas you want to search, and then select **Search Data Table** from the context menu. The following figure shows options available in the **Search** tab.

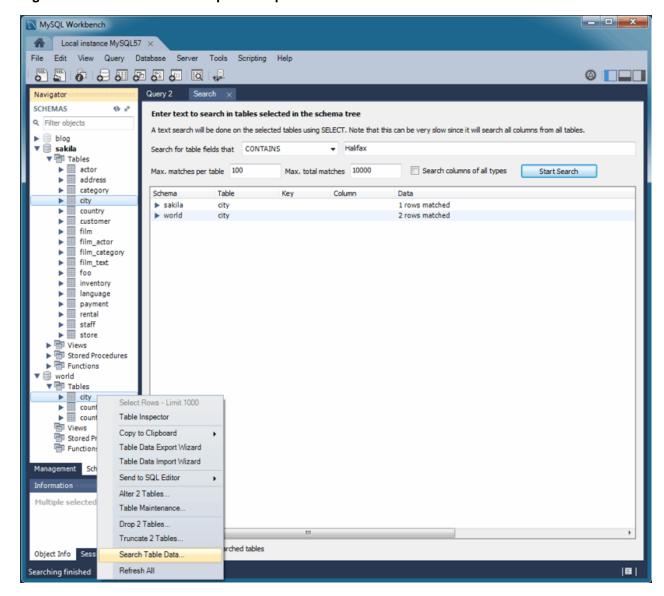

Figure 8.12 Table Search Example: Multiple Tables and Schemas

The search options include:

- Search for table fields that: "CONTAINS", "Search using =", "Search using LIKE", "Search using REGEXP". These search options are case-insensitive.
- Max. matches per table: [100]
- Max. total matches: [1000]
- Search columns of all types check box: If checked, non-text column type columns are cast to CHAR
  to perform the matches, otherwise only text types (CHAR, VARCHAR, and TEXT) are searched. This is
  unchecked by default.

# 8.1.9 Export or Import a Table

Export or import tables using a wizard to assist you.

#### Note

These wizards were added in MySQL Workbench 6.3.

# **Export a Table**

#### Note

Alternatively, use Section 6.5, "Data Export and Import" to export larger sets of data, such as entire tables and databases.

# **Import into Table**

#### Note

Alternatively, use Section 6.5, "Data Export and Import" to export larger sets of data, such as entire tables and databases.

# 8.1.10 The MySQL Table Editor

The MySQL Table Editor is a used to create and modify tables. You can add or modify the columns or indexes of a table, change the engine, add foreign keys, or alter the table name.

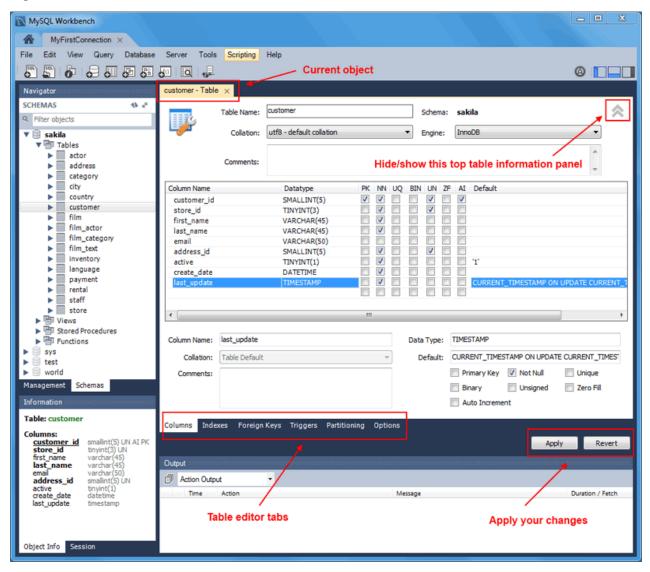

To access the MySQL Table Editor, right-click on a table name in the Navigator panel with the **Schemas** tab selected and choose **ALTER TABLE**. This action opens a new tab within the main **SQL Editor** window. You can also access the MySQL Table Editor from an EER Diagram by double-clicking on a table object.

### 8.1.10.1 The Main Editor Window

Any number of tables may be edited in the MySQL Table Editor at any one time. Adding another table creates a new tab at the top of the editor. By default, the MySQL Table Editor appears docked at the top of the table editor tab, within the SQL editor.

The MySQL Table Editor for the customer table is shown in following figure.

Figure 8.13 The Table Editor

The MySQL Table Editor provides a work space that has tabs used to perform these actions:

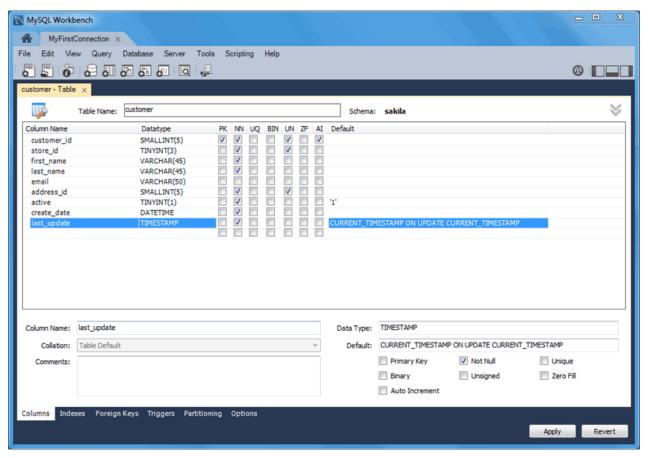

- Columns: Add or modify columns
- Indexes: Add or modify indexes
- · Foreign Keys: Add or modify foreign keys
- Triggers: Add or modify triggers
- Partitioning: Manage partitioning
- · Options: Add or modify other options, divided in categories named general, row, storage, and merge

# 8.1.10.2 The Columns Tab

Use the **Columns** tab to display and edit all the column information for a table. With this tab, you can add, drop, and alter columns.

You can also use the **Columns** tab to change column properties such as name, data type, and default value. The following figure shows an example of the **Columns** tab.

Figure 8.14 The Columns Tab

Right-click a row under the Column Name column to open a pop-up menu with the following items:

- Move Up: Move the selected column up.
- Move Down: Move the selected column down.
- Copy: Copies the column for a model.
- Cut: Copies and then deletes the column for a model.
- Paste: Pastes the column. If a column with the same name already exists, then \_copy1 is appended to
  the column name.
- **Delete Selected Columns**: Select multiple contiguous columns by right-clicking and pressing the **Shift** key. Use the **Control** key to select separated columns.
- Refresh: Update all information in the Columns tab.
- Clear Default: Clear the assigned default value.
- Default NULL: Set the column default value to NULL.
- Default 0: Set the column default value to 0.

- **Default CURRENT\_TIMESTAMP**: Available for TIMESTAMP data types.
- **Default CURRENT\_TIMESTAMP ON UPDATE CURRENT\_TIMESTAMP**: Available for TIMESTAMP data types.

To add a column, click the Column Name field in an empty row and enter an appropriate value. Select a data type from the **Datatype** list. Select the column property check boxes as required according to the list of column properties below, and also read the CREATE TABLE documentation for information about what these options mean.

• PK: PRIMARY KEY

• NN: NOT NULL

UQ: UNIQUE INDEX

• BIN: BINARY

UN: UNSIGNED

• ZF: ZEROFILL

• AI: AUTO INCREMENT

• G: Generated Column

This option is available as of MySQL Server 5.7.

To change the name, data type, default value, or comment of a column, double-click the value to edit it.

You can also add column comments to the Column Comment field. It is also possible to set the column collation, using the list in the Column Details panel.

To the left of the column name is an icon that indicates whether the column is a member of the primary key. If the icon is a small key, that column belongs to the primary key, otherwise the icon is a blue diamond or a white diamond. A blue diamond indicates the column has **NN** set. To add or remove a column from the primary key, double-click the icon. You can also add a primary key by checking the PRIMARY KEY check box in the Column Details section of the table editor.

If you wish to create a composite primary key you can select multiple columns and check the PK check box. However, there is an additional step that is required, you must click the Indexes tab, then in the Index Columns panel you must set the desired order of the primary keys.

## Note

When entering default values, in the case of CHAR and VARCHAR data types MySQL Workbench will attempt to automatically add quotation marks, if the user does not start their entry with one. For other data types the user must manage quoting if required, as it will not be handled automatically by MySQL Workbench.

#### Caution

Care must be taken when entering a default value for ENUM columns because a non-numeric default will not be automatically quoted. You must manually add single quote characters for the default value. Note that MySQL Workbench will **not** prevent you from entering the default value without the single quotation marks. If a non-numeric default value is entered without quotation marks, this will lead

to errors. For example, if the model is reverse engineered, the script will contain unquoted default values for ENUM columns and will fail if an attempt is made to run the script on MySQL Server.

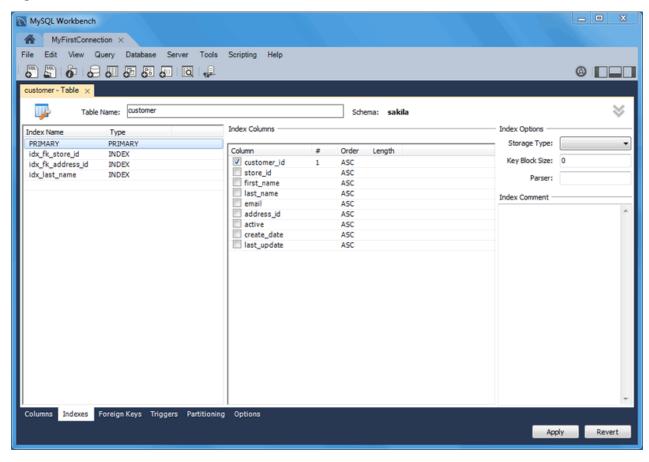

#### Note

ENUM, BIT, and SET must contain at least one value when entering these data types into MySQL Workbench.

#### 8.1.10.3 The Indexes Tab

The **Indexes** tab holds all index information for your table. Use this tab to add, drop, and modify indexes. The following figure shows an example of the layout.

Figure 8.15 The Indexes Tab

Select an index by right-clicking it. The **Index Columns** section displays information about the selected index.

To add an index, click the last row in the index list. Enter a name for the index and select the index type from the list. Select the column or columns that you wish to index by checking the column name in the **Index Columns** list. You can remove a column from the index by removing the check mark from the appropriate column.

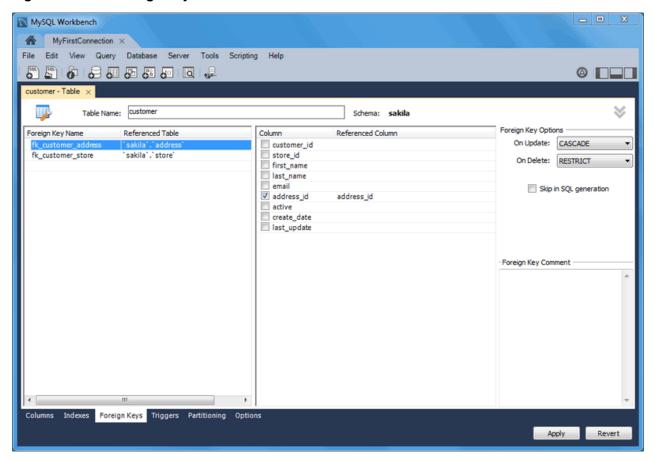

You can also specify the order of an index by choosing ASC or DESC under the Order column. Create an index prefix by specifying a numeric value under the Length column. You cannot enter a prefix value for fields that have a data type that does not support prefixing.

To drop an index, right-click the row of the index you wish to delete, then select the **Delete Selected Indexes** menu item.

# 8.1.10.4 The Foreign Keys Tab

The **Foreign Keys** tab is organized in much the same fashion as the **Indexes** tab and adding or editing a foreign key is similar to adding or editing an index. The following figure shows an example of the **Foreign Keys** tab.

Figure 8.16 The Foreign Keys Tab

To add a foreign key, click the last row in the Foreign Key Name list. Enter a name for the foreign key and select the column or columns that you wish to index by checking the column name in the **Column** list. You can remove a column from the index by removing the check mark from the appropriate column.

Under Foreign Key Options, choose an action for the update and delete events. The options are:

- RESTRICT
- CASCADE
- SET NULL
- NO ACTION

To drop a foreign key, right-click the row you wish to delete, then select the **Delete Selected FKs** menu item.

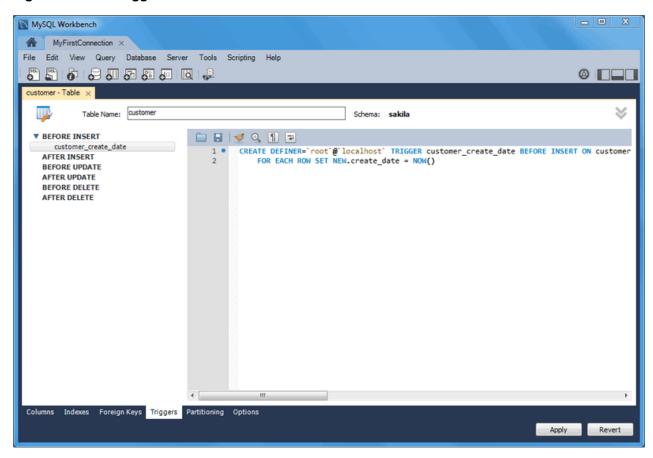

To modify properties of a foreign key, select it and make the desired changes.

# 8.1.10.5 The Triggers Tab

The **Triggers** tab opens a workspace that enables you to create new triggers or edit existing triggers. All triggers are organized within a tree structure by section, such as **BEFORE INSERT** and **AFTER INSERT**.

To add a new trigger, click the [+] icon next to the trigger section. To delete a trigger, click the associated [-] icon. These icons become visible by hovering over a trigger or trigger section. Click **Apply** to commit your changes. The next figure shows an example of the customer\_create\_date trigger.

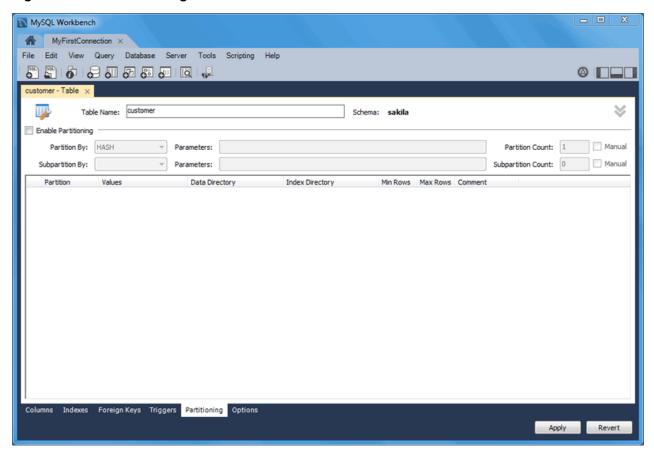

Figure 8.17 The Triggers Tab

# 8.1.10.6 The Partitioning Tab

To enable partitioning for your table, check the **Enable Partitioning** check box. This enables the partitioning options (shown in the figure that follows).

Figure 8.18 The Partitioning Tab

The Partition By pop-up menu displays the types of partitions you can create:

- HASH
- LINEAR HASH
- KEY
- LINEAR KEY
- RANGE
- LIST

Use the **Parameters** field to define any parameters to be supplied to the partitioning function, such as an integer column value.

Choose the number of partitions from the **Partition Count** list. To manually configure your partitions, check the **Manual** check box. This enables entry of values into the partition configuration table. The entries in this table are:

- Partition
- Values
- Data Directory

- Index Directory
- Min Rows
- Max Rows
- Comment

Subpartitioning is also available. For more information about partitioning, see Partitioning.

# 8.1.10.7 The Options Tab

The **Options** tab enables you to set several types of options. The next figure shows an example of this tab.

### Figure 8.19 The Options Tab

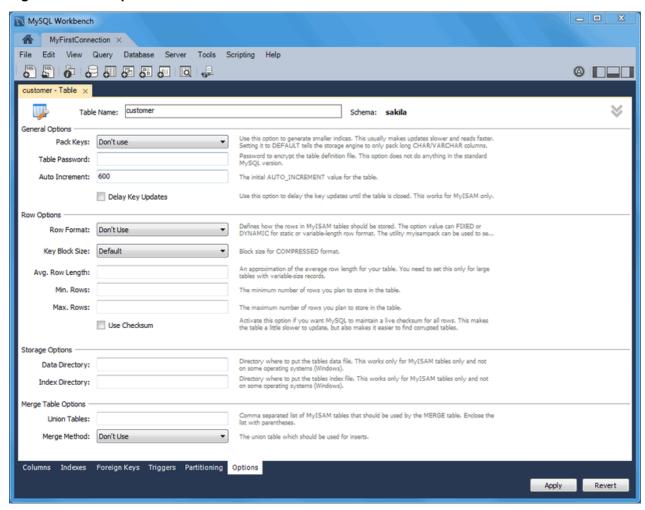

Table options are grouped into the following sections:

- General Options
- Row Options
- Storage Options
- Merge Table Options

The following sections describe these options in more detail.

### **General Options Section**

In the **General Options** section, choose a pack keys option. The options are <code>Default</code>, <code>Pack None</code>, and <code>Pack All</code>. You may also encrypt the definition of a table. The <code>AUTO\_INCREMENT</code> and delayed key update behaviors apply only to <code>MyISAM</code> tables.

# **Row Options Section**

To set the row format, choose the desired row format from the list. For more information about the different row formats that are available, see MylSAM Table Storage Formats.

These options are:

- Default
- Dynamic
- Fixed
- Compressed
- Redundant
- Compact

When you expect a table to be particularly large, use the **Avg. Row**, **Min. Rows**, and **Max. Rows** options to enable the MySQL server to better accommodate your data. See CREATE TABLE Syntax for more information on how to use these options.

# **Storage Options Section**

The Storage Options section is available only for MyISAM tables. Use it to configure a custom path to the table storage and data files. This can help improve server performance by locating different tables on different hard drives.

# **Merge Table Options Section**

Use the Merge Table Options section to configure MERGE tables. To create a MERGE table, select MERGE as your storage engine and then specify the MyISAM tables you wish to merge in the **Union Tables** dialog.

You may specify the action the server should take when users attempt to perform INSERT statements on the merge table. You may also select the Merge Method by selecting from the list. For more information about MERGE tables, see The MERGE Storage Engine.

# 8.1.11 Code Generation Overview

This document provides a quick hands-on introduction to using MySQL Workbench to generate code for later use, for either in or outside of MySQL Workbench.

# 8.1.11.1 Generating SQL Statements

MySQL Workbench can be used to generate SQL, most typically as either INSERT statements or SELECT statements.

Below are common methods for generating SQL statements in MySQL Workbench.

### Note

All of the MySQL Workbench Export options include the option to export as SQL.

Context-menu options after right-clicking on a schema in the schema view, using the sakila column as an example:

#### **Create Statement**

```
CREATE DATABASE `sakila` /*!40100 DEFAULT CHARACTER SET latin1 */;
```

#### Name

```
`sakila`
```

Context-menu options after right-clicking on a table in the schema view, using the sakila.actor column as an example:

### Name (Short)

```
`actor`
```

## Name (Long)

```
`sakila`.`actor`
```

## **Select All Statement**

```
SELECT `actor`.`actor_id`,
   `actor`.`first_name`,
   `actor`.`last_name`,
   `actor`.`last_update`
FROM `sakila`.`actor`;
```

# **Select with References**

```
SET @actor_id_to_select = <{row_id}>;
SELECT film_actor.*
   FROM film_actor, actor
   WHERE `actor`.`actor_id` = `film_actor`.`actor_id`
        AND actor.actor_id = @actor_id_to_select;
SELECT actor.*
   FROM actor
```

```
WHERE actor.actor_id = @actor_id_to_select;
```

#### **Insert Statement**

```
INSERT INTO `sakila`.`actor`
  ('actor_id`,
  `first_name`,
  `last_name`,
  `last_update`)
VALUES
  (<{actor_id: }>,
  <{first_name: }>,
  <{last_name: }>,
  <{last_name: }>,
```

### **Update Statement**

```
UPDATE `sakila`.`actor`
SET
  `actor_id` = <{actor_id: }>,
  `first_name` = <{first_name: }>,
  `last_name` = <{last_name: }>,
  `last_update` = <{last_update: CURRENT_TIMESTAMP}>
WHERE `actor_id` = <{expr}>;
```

#### **Delete Statement**

```
DELETE FROM `sakila`.`actor`
WHERE <{where_expression}>;
```

#### **Delete with References**

#### **Create Statement**

```
CREATE TABLE `actor` (
  `actor_id` smallint(5) unsigned NOT NULL AUTO_INCREMENT,
  `first_name` varchar(45) NOT NULL,
  `last_name` varchar(45) NOT NULL,
  `last_update` timestamp NOT NULL DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP,
  PRIMARY KEY (`actor_id`),
  KEY `idx_actor_last_name` (`last_name`)
) ENGINE=InnoDB AUTO_INCREMENT=201 DEFAULT CHARSET=utf8;
```

Context-menu options after right-clicking on a column in the schema view, using the sakila.actor.first\_name column as an example:

### Name (short)

```
`first_name`
```

## Name (long)

```
`actor`.`first_name`
```

#### **Select Columns Statement**

```
SELECT `first_name` FROM `sakila`.`actor`;
```

#### **Insert Statement**

```
INSERT INTO `sakila`.`actor`
(`first_name`)
VALUES
(<{first_name}>);
```

## **Update Statement**

```
UPDATE `sakila`.`actor`
SET
    `first_name` = <{first_name}>
WHERE <{where_expression}>;
```

Context-menu options after right-clicking on a field in the results view, using record #1 in the sakila.actor table as an example:

### Copy Rows (with names)

```
# actor_id, first_name, last_name, last_update
'1', 'PENELOPE', 'GUINESS', '2006-02-15 04:34:33'
```

## Copy Rows (with names, unquoted)

```
# actor_id, first_name, last_name, last_update
1, PENELOPE, GUINESS, 2006-02-15 04:34:33
```

## Copy Row (tab separated)

```
1 PENELOPE GUINESS 2006-02-15 04:34:33
```

#### Copy Field

```
'GUINESS'
```

# 8.1.11.2 Generating PHP Code

MySQL Workbench can be used to generate PHP code with the bundled PHP plugin, by using the **Tools**, **Utilities**, **Copy** as **PHP Code** menu option.

Below is an example scenario for how to create PHP code. It is a SELECT statement, and optionally uses SET to set variables.

SQL @variables generate PHP variables in the code that then bind to the statement before execution.

1. Generate or type in the desired SQL query into the SQL editor. This example will use the sakila database, with the query being:

```
SET @last_update = '2006-02-14';

SELECT actor_id, first_name, last_update
FROM actor
WHERE last_update > @last_update;
```

- 2. While in the SQL editor, choose **Tools**, **Utilities**, **Copy as PHP Code (Iterate SELECT Results)** from the main menu. This will copy PHP code to the clipboard.
- 3. Paste the code to the desired location.

Additionally, PHP code that connects to the MySQL database can also be generated by choosing **Tools**, **Utilities**, **Copy as PHP Code (Connect to Server)**.

After combining the two, the generated PHP code will look like this:

```
<?php

$host = "localhost";
$port = 3306;
$socket = "";
$user = "nobody";</pre>
```

```
$password = "";
$dbname = "sakila";
$con = new mysqli($host, $user, $password, $dbname, $port, $socket)
   or die ('Could not connect to the database server' . mysqli_connect_error());
//$con->close();
$query = "SELECT actor_id, first_name, last_name, last_update
         FROM actor
         WHERE last_update > ?";
$last_update = '';
$stmt->bind_param('s', $last_update);
if ($stmt = $con->prepare($query)) {
   $stmt->execute();
   $stmt->bind_result($actor_id, $first_name, $last_name, $last_update);
   while ($stmt->fetch()) {
       // printf("%s, %s, %s, %s\n",
        // $actor_id, $first_name, $last_name, $last_update);
   $stmt->close();
```

#### Note

The generated PHP code uses the <code>mysqli</code> PHP extension for MySQL. This extension must be enabled in your PHP distribution for this code to work. For additional details about this PHP extension, see MySQL Improved Extension.

# 8.2 Object Management

The Object Browser allows you to navigate database schemas and objects. From here, you can perform common tasks such as selecting tables and fields to query, edit tables, create new or drop tables and databases, perform searches, and more.

# 8.2.1 Object Browser and Editor Navigator

The Navigator panel contains options to manage the active MySQL connection, and also lists the schemas available to that connection. To access the Navigator panel, open an existing connection from the home screen. If the panel is not visible, click **View**, **Panels**, and then **Show Sidebar**.

# **Navigator Schemas Tab**

The Schemas list shows available schema on the currently connected server. These items can be explored to show tables, views, and routines within the schema as the following figure shows.

#### Note

Internal schemas, such as "performance\_schema", "information"schema", "sys", and "mysql", are hidden by default. Toggle the **Show Metadata and Internal Schemas** preference to list them in the object browser. Schemas beginning with a "." are also controlled by this setting.

Figure 8.20 SQL Editor - Navigator Schemas Tab

It is possible to set a schema as the default schema by right-clicking the schema and selecting the **Set As Default Schema** menu item. This executes a USE schema\_name statement so that subsequent statements without schema qualifiers are executed against this schema. This setting applies only to the query session. To set a default schema for multiple MySQL Workbench sessions, you must set the default schema for the stored connection. From the home screen, right-click on a MySQL connection, choose **Edit Connection**, and set the desired default schema on the **Default Schema** box.

#### Note

The selected schema is displayed as **bold** in the Schema navigator.

Double-clicking a table, view, or column name in the schemata explorer inserts the name into the SQL Query area. This reduces typing significantly when entering SQL statements containing references to several tables, views, or columns.

The Schema Navigator also features a context menu which can be displayed by right-clicking an object. For example, right-clicking a table displays the following menu items:

- **Select Rows Limit 1000**: Pulls up to 1000 rows of table data from the live server into a Results tab, and enables editing. Data can be saved directly to the live server.
- **Table Inspector**: Displays table information, similar to the Schema Inspector. This also has a simpler and easier to use interface for analyzing and creating indexes for tables.
- Table Data Export: Opens the table export wizard to export the table's data to JSON or customized CSV.
- Table Data Import: Opens the table import wizard to import JSON or CSV formatted data to the selected or new table.
- Copy to Clipboard: There are various submenus, each of which copies information to the clipboard:
  - Name (short): Copies the table name.
  - Name (long): Copies the qualified table name in the form `schema`. `table`.
  - Select All Statement: Copies a statement to select all columns in this form:

- Insert Statement: Copies an INSERT statement to insert all columns.
- Update Statement: Copies an UPDATE statement to update all columns.
- Delete Statement: Copies a DELETE statement in the form DELETE FROM `world`.`country` WHERE <{where\_condition}>;.
- Create Statement: Copies a CREATE statement in the form DELETE FROM `world`.`country` WHERE <{where\_condition}>;.
- Delete with References: Copies a DELETE statement, in the form of a transaction, that deletes all objects that reference the row (directly or indirectly).

Use **Select with References** first to preview this operation.

• Select with References: Copies a SELECT statement that selects all objects that reference the row (directly or indirectly).

Use **Delete with References** to generate a DELETE statement for this operation.

- **Send to SQL Editor**: Provides functionality similar to Copy to Clipboard. However, this item inserts the SQL code directly into the SQL Query panel, where it can be edited further as required.
- Create Table: Launches a dialog to enable you to create a new table.
- Create Table Like...: Launches a dialog to enable you to create a new table, and to also apply predefined templates. For additional information, see Section 9.6, "Table Templates".
- Alter Table...: Displays the table editor loaded with the details of the table.

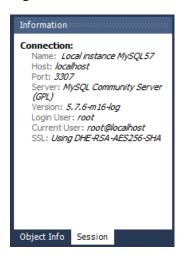

- **Table Maintenance**: Opens a new tab for performing table maintenance operations. Operations include "Analyze Table", "Optimize Table", "Check Table", and "Checksum Table". Additional information about the table may also be viewed from this tab. For additional information, see Schema Inspector.
- Drop Table...: Drops the table. All data in the table will be lost if this operation is carried out.
- Truncate Table...: Truncates the table.
- Search Table Data...: Opens a new tab for performing table searches. It performs a search on all columns, and offers additional options to limit the search.
- Refresh All: Refreshes all schemata in the explorer by resynchronizing with the server.

Right-clicking on a schema provides similar options to the table context menu described above, but the operations refer to the Schema. For example, the **Table Maintenance** in the table context menu selects the table in the **Schema Inspector**, which is a schema context menu option.

# 8.2.2 Session and Object Information Panel

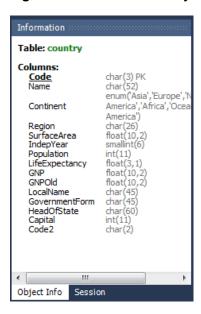

The **Session** tab of the Information panel summarizes the current connection to the server, as the following figure shows.

Figure 8.21 SQL Editor - Connection Information Palette

The **Object Info** tab of the Information panel summarizes information about a specific object, such as a table. The following figure shows an example of object information.

Figure 8.22 SQL Editor - Object Info

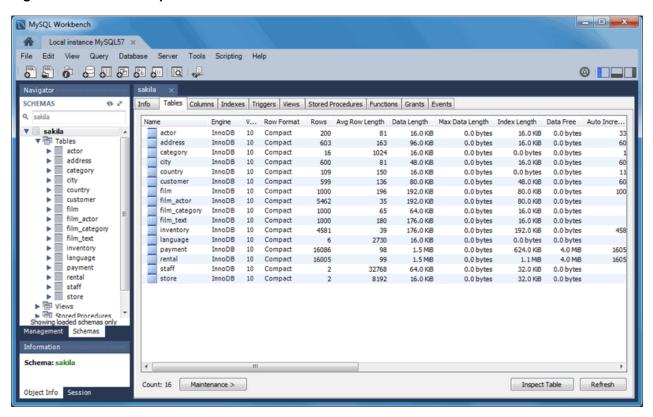

# 8.2.3 Schema and Table Inspector

The Schema and Table Inspector includes the ability to analyze and repair tables, and also view table metrics.

# **Schema Inspector**

Use the Schema Inspector to browse general information from schema objects (shown in the figure that follows). It allows you to perform maintenance tasks on tables such as ANALYZE, OPTIMIZE, CHECK, and CHECKSUM TABLE. To access the inspector, right-click a schema and select the **Schema Inspector**.

Figure 8.23 Schema Inspector

Each tab lists topic-oriented information, such as "Tables", "Indexes", and "Triggers". From the **Tables** tab, click **Inspect Table** to open the **Table Inspector**, or **Maintenance** to open the table maintenance tools (shown in the figure that follows).

# **Table Inspector**

You can use the Table Inspector to view table information, which is similar to the Schema Inspector. The Table Inspector includes an easy-to-use interface for analyzing and creating indexes for your tables.

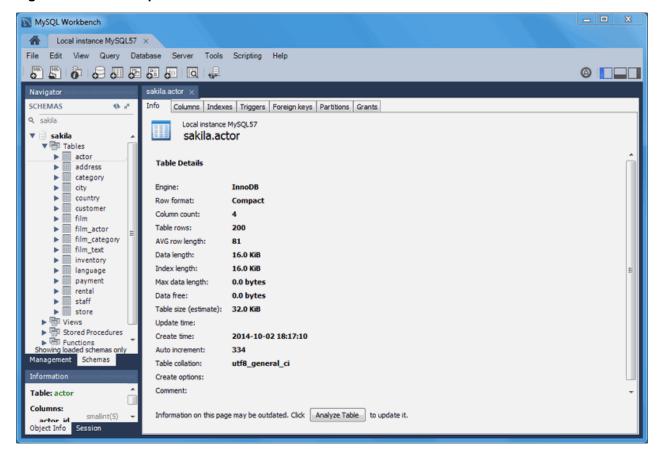

To open, right-click a table in the object browser of the Navigator pane and choose **Table Inspector** from the context menu as demonstrated in the following figure.

Modeling simplifies database design and maintenance by enabling you, the data architect, to visualize requirements and resolve design issues. Model-driven database design is an efficient methodology for creating valid and well-performing databases, while providing the flexibility to respond to evolving data requirements. Models are used to build ER diagrams and physical MySQL databases.

MySQL Workbench provides extensive capabilities for creating and manipulating database models, including these:

- · Create and manipulate a model graphically.
- Reverse engineer a live database to a model.
- Forward engineer a model to a script or live database.
- · Create and edit tables and insert data.

This is not an exhaustive list. The following sections describe these and additional data-modeling capabilities.

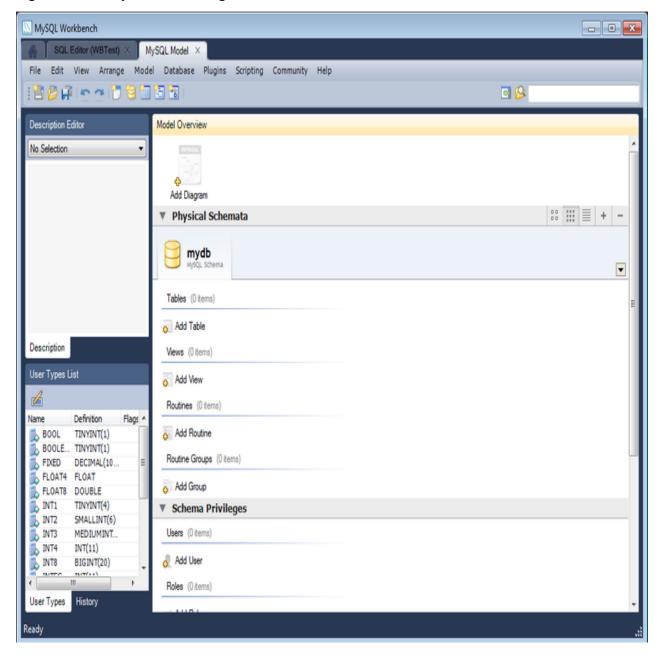

# 9.1 Modeling Interface

Modeling concepts and interface elements are described below.

## 9.1.1 Model Editor

When the Model Editor is executed from the home screen, MySQL Workbench displays the MySQL Model page. The MySQL Model page has three main panels, as shown in the following figure: Description Editor, User Types List/History panel, and Model Overview.

Figure 9.1 The MySQL Model Page

The Description Editor and User Types List/History panel are contained within the sidebar. The sidebar can be relocated using a setting in the Workbench Preferences dialog.

The Model Overview panel includes the following sections:

- · EER Diagrams
- Physical Schemata
- Schema Privileges
- SQL Scripts
- · Model Notes

For each of these sections, add objects to a project by clicking the appropriate add-object icon. You may also rename, edit, cut, copy, or delete objects on this page by right-clicking to open a context menu.

The following sections further discuss the MySQL Model page.

# 9.1.1.1 Modeling Menus

Some menu items are not available in the MySQL Workbench Community Edition of this application, and are available only in the MySQL Workbench Commercial Editions;. This is indicated where applicable.

#### The File Menu

Use the **File** menu to open a project, begin a new project, or save a project. Choosing **Model** opens the default schema, mydb. Choosing **Open Model** opens a file dialog box with the default file type set to MySQL Workbench Models (mwb extension). To display a list of recently opened MWB files, choose the **Open Recent** menu item. The keyboard shortcut to create a new project is **Control+N** and the command to open an existing project is **Control+O**.

To close the currently active MySQL Model or EER Diagram tab, use the **Close Tab** menu item. You can also do this from the keyboard by pressing **Control+W**. To reopen the MySQL Model tab, see The View Menu. To reopen an EER Diagram tab, double-click the EER Diagram icon in the EER Diagrams section of the MySQL Model page.

Use the **Save Model** or **Save Model As** menu items to save a model. When you save a model, its name appears in the title bar of the application. If you have made changes to a project and have not saved those changes, an asterisk appears in the title bar following the model name. When you save a model, it is saved as a MySQL Workbench file with the extension mwb.

Use the **Import** menu item to import a MySQL data definition (DDL) script file. For example, this might be a file created by issuing the command mysqldump --no-data. MySQL Workbench handles the script as follows:

- If the script does not contain a CREATE DATABASE *db\_name*; statement, the schema objects are copied to the default schema, mydb.
- If the script creates a database, a new tab bearing the database name is added to the Physical Schemata section of the MySQL Model page.
- If the script contains data, the data is ignored.

For details about importing a DDL script, see Section 9.4.2.1, "Reverse Engineering Using a Create Script".

Under the **Import** submenu, you can also import DBDesigner4 files.

There are variety of items under the **Export** submenu. You may generate the SQL statements necessary to create a new database or alter an existing one. For more information about these menu items, see Section 9.4.1.1, "Forward Engineering Using an SQL Script".

Using the **Export** submenu, you can also export an EER diagram as a PNG, SVG, PDF, or Postscript file. For an example of a PNG file, see Figure 9.29, "The sakila Database EER Diagram".

The **Page Setup** menu item enables you to set the paper size, orientation, and margins for printing purposes.

The printing options are enabled only if the **EER Diagrams** tab is selected. You have the choice of printing your model directly to your printer, printing it as a PDF file, or creating a PostScript file. For more information, see Section 9.2.1, "Printing Diagrams".

#### Note

The printing options are available only in Commercial Editions of MySQL Workbench.

Use the **Document Properties** menu item to set the following properties of your project:

• Name: The model name (default is MySQL Model)

• Version: The project version number

• Author: The project author

• Project: The project name

• Created: Not editable; determined by the MWB file attributes

Last Changed: Not editable; determined by the MWB file attributes

• Description: A description of your project

# The Edit Menu

Use the **Edit** menu to make changes to objects. The menu item text descriptions change to reflect the name of the selected object.

This menu has items for cutting, copying, and pasting. These actions can also be performed using the **Control+X**, **Control+C**, and **Control+V** key combinations. Undo a deletion using the **Undo Delete** 'object\_name' item. The **Control+Z** key combination can also be used to undo an operation. It is also possible to carry out a **Redo** operation using either the menu item, or the key combination **Control+Y**.

Also find a **Delete 'object\_name'** menu item for removing the currently selected object. The keyboard command for this action is **Control+Delete**. You can also right-click an object and choose the delete option from the pop-up menu.

The **Delete** 'object\_name' menu item behaves differently depending upon circumstances. For example, if an **EER Diagram** is active and a table on the canvas is the currently selected object, a dialog box may open asking whether you want to remove the table from the canvas only or from the database as well. For information about setting the default behavior when deleting from an EER Diagram, see Section 3.2.4, "Modeling Preferences".

#### Warning

If the  ${\tt MySQL}$  Model page is active, the selected object is deleted from the catalog and there will be no confirmation dialog box.

Choose **Edit Selected** to edit the currently selected object. You can also perform edits in a new window by selecting **Edit Selected in New Window**. The keyboard shortcuts for **Edit Selected** and **Edit Selected in New Window** are **Control+E** and **Control+Shift+E**, respectively.

The **Select** item has the following submenus:

- Select All (Keyboard shortcut, Control+A): Selects all the objects on the active EER diagram.
- Similar Figures (Objects of the same type): Finds objects similar to the currently selected object.
- Connected Figures: Finds all the objects connected to the currently selected object.

These menu items are active only when an **EER Diagram** tab is selected. The **Similar Figures** and the **Connected Figures** menu items are disabled if no object is currently selected on an EER diagram.

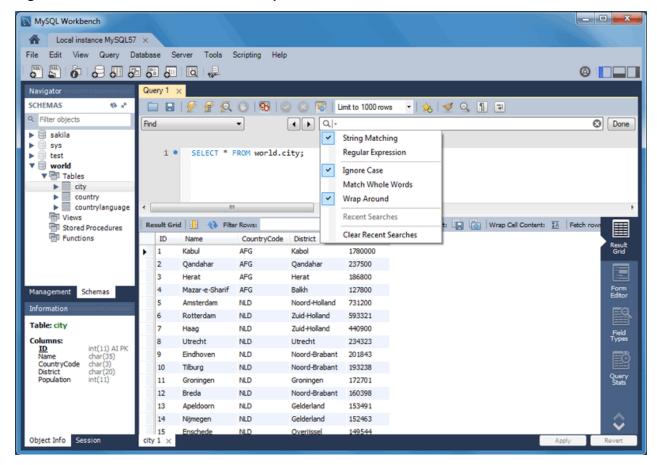

When multiple objects have been selected using one of these menu items, you can navigate between selected items by choosing the **Go to Next Selected** or **Go to previous Selected** menu item.

Selecting objects changes some of the **Edit** menu items. If only one object is selected, that object's name appears after the **Cut**, **Copy** and **Delete** menu items. If more than one object is selected, these menu items show the number of objects selected.

# **Find Dialog Window**

Each MySQL Workbench window includes search functionality. The **Find** panel with **Find & Replace** enabled is shown in the following figure.

Figure 9.2 The Find Panel with Find & Replace

# Find Options

The Find dialogue options are described below:

- **String Matching** (default) or **Regular Expression**: Search by matching a string, or a PCRE regular expression.
- Ignore Case: A case-insensitive search. Works with both the String Matching and Regular Expression search methods. Enabled by default.
- Match Whole Words: If enabled, only whole strings are matched. For example, a search for "home" would not match "home id". Disabled by default.
- Wrap Around: The search will wrap around to the beginning of the document, as otherwise it will only search from the cursor position to the end of the document. Enabled by default.
- And the arrows jump to the discovered search terms, and behave according to the Wrap Around option.

The MySQL Workbench Commercial Editions include an advanced Find facility for models, as indicated in the figure that follows.

Figure 9.3 The Find Window

You can search the following locations:

- Entire Model: Searches the entire model.
- Current View: Searches the current view only. This may be the MySQL Model page.
- All Views: Searches the MySQL Model Page and all EER diagrams.
- Database Objects: Searches database objects only.

• Selected Figures: Searches the currently selected objects. This feature works only for EER diagrams.

Enter the text you wish to search for in the **Find Text** list. You may also select any or all of the following check boxes:

- Match Case
- Whole Word
- · Use Regular Expression
- · Search in Comments
- · Search in SQL for Views, SPs etc.

Any text you enter into the **Find Text** list is retained for the duration of your session. Use the **Next** or **Previous** buttons to find occurrences of your search criterion.

Clicking the **Find All** button opens a **Find Results** window anchored at the bottom of the application. If you wish, you may undock this window as you would any other.

Use this window to navigate to objects. For example, double-clicking the <code>Description</code> of an object located on an EER diagram navigates to the specific diagram and selects the object. Notice that the properties of the object are displayed in the <code>Properties</code> palette.

The Find dialog window can also be opened using the **Control+F** key combination. Use **Control+G** to find the next occurrence and **Control+Shift+G** to find a previous occurrence. Close the Find dialog window by clicking the **x** in the top right corner or by pressing the **Esc** key.

#### **Workbench Preferences**

This menu item enables you to set global preferences for the MySQL Workbench application.

For further information, see Section 3.2, "Workbench Preferences".

### The View Menu

This context-aware menu features general options for changing the view in MySQL Workbench. These options change depending on the current tab, and here are the available **View** menu items:

#### General options:

- Home: Selects the home screen.
- Panels: Configure which of the three available panels are open. You may also manage this from the GUI using the panel toggle buttons on the top-right side of MySQL Workbench.
- Output: Displays the console output.
- Select Next Main Tab: Selects the next (moves to the right, and wraps around) MySQL Workbench tab.
- Select Next Main Tab: Selects the previous (moves to the left, and wraps around) MySQL Workbench tab.

# Model/EER options:

- **Windows**: A submenu with items that activate (slide open) specific panels. Designated panels include the "Model Navigator", "Catalog", "Layers", "User Datatypes", "Object Descriptions", "Object Properties", and "Undo History".
- **Zoom 100%**: The default level of detail of an EER diagram.

- Zoom In: Zooms in on an EER diagram.
- Zoom Out: Zooms out from an EER diagram.

The ability to zoom in on an EER diagram is also available using the slider tool in the Model Navigator palette. See Section 9.1.1.9, "The Model Navigator Panel".

- **Set Marker**: Bookmarks an object. From the keyboard, select the object you wish to bookmark, then use the key combination **Control+Shift** and the number of the marker (1 through 9). You may create up to nine markers.
- **Go To Marker**: Returns to a marker. From the keyboard, use the **Control** key and the number of the marker.
- Toggle Grid: Displays grid lines on an EER diagram.
- Toggle Page Guides: Toggles Page Guides to help design the EER diagram on a per-page basis.

# The Arrange Menu

The **Arrange** menu items apply only to objects on an EER diagram canvas and are enabled only if an EER diagram view is active. The **Arrange** menu has these items:

- . Align to Grid: Aligns items on the canvas to the grid lines
- . Bring to Front: Brings objects to the foreground
- Send to Back: Sends objects to the background
- Center Diagram Contents: Centers objects on the canvas
- Autolayout: Automatically arranges objects on the canvas
- Reset Object Size: Expands an object on an EER diagram. For example, if a table has a long column name that is not fully displayed, this menu item expands the table to make the column visible. This menu item is not enabled unless an object is selected.
- Expand AII: Use this item to expand all objects on an EER diagram. This item will display a table's columns if the object notation supports expansion. Some object notations, such as Classic, do not permit expansion or contraction. Indexes will not automatically be expanded unless they were previously expanded and have been collapsed using the Collapse AII menu item.
- Collapse All: Undo the operation performed by Expand All.

#### The Model Menu

When a model is opened, this menu features actions to perform against your model, and the **Model** menu has these items:

- Add Diagram: Creates a new EER Diagram. The keyboard shortcut is Control+T.
- Create Diagram From Catalog Objects: Creates an EER diagram from all the objects in the catalog.
- User Defined Types: Presents a dialog box that enables you to add and delete user defined data types.
- **DBDoc Model Reporting...**: For information about this menu item, see The DBDoc Model Reporting Dialog Window (Commercial Editions). Commercial Editions only.
- Validation: Checks the validity of the model using ANSI standards. For information about this menu item, see The Validation Submenus (Commercial Editions). Commercial Editions only.

- Validation (MySQL): Checks the validity of the model using MySQL standards. For information about this menu item, see The Validation Submenus (Commercial Editions). Commercial Editions only.
- Object Notation: For information about this menu item, see The Object Notation Submenu.
- Relationship Notation: For information about this menu item, see The Relationship Notation Submenu.
- **Diagram Properties and Size**: Opens a diagram size dialog box that enables you to adjust the width or height of the canvas. The unit of measure is pages; the default value is two.

When you have tables with numerous columns, use this menu item to increase the size of the EER.

• **Model Options**: Sets options at the model level. These options should not be confused with the options that are set globally for the Workbench application, and which are referred to as Workbench Preferences. The available model options are a subset of the Workbench Preferences options.

For more information about Workbench Preferences, see Section 3.2.4, "Modeling Preferences".

#### The DBDoc Model Reporting Dialog Window (Commercial Editions)

This dialog window is found by navigating to the **Model** menu and choosing the **DBDoc - Model Reporting...** item.

#### **Note**

The **DBDoc - Model Reporting...** feature is only available in the MySQL Workbench Commercial Editions.

Use this dialog window to set the options for creating documentation of your database models. For more information, see Section 9.2.2, "DBDoc Model Reporting".

#### The Validation Submenus (Commercial Editions)

The **Model** menu has two validation submenus, **Validation** and **Validation** (**MySQL**). Use these submenus for general validation and MySQL-specific validation of the objects and relationships defined in your model.

#### Note

These items are only available in the MySQL Workbench Commercial Editions.

The Validation submenu has these items:

- Validate All: Performs all available validation checks
- Empty Content Validation: Checks for objects with no content, such as a table with no columns
- Table Efficiency Validation: Checks the efficiency of tables, such as a table with no primary key defined
- **Duplicate Identifiers Validation**: Checks for duplicate identifiers, such as two tables with the same name
- Consistency Validation: Checks for consistent naming conventions
- Logic Validation: Checks, for example, that a foreign key does not reference a nonprimary key column in the source table

The Validation (MySQL) submenu has these items:

- Validate All: Performs all available validation checks
- Integrity Validation: Checks for invalid references, such as a table name longer than the maximum permitted
- Syntax validation: Checks for correct SQL syntax
- Duplicate Identifiers Validation (Additions): Checks for objects with the same name

For detailed information about validation, see Section 9.2.3, "Schema Validation Plugins".

#### The Object Notation Submenu

The items under the **Model**, **Object Notation** submenu apply exclusively to an EER diagram. They are not enabled unless an EER diagram tab is selected.

The **Object Notation** submenu has these items:

- Workbench (Default): Displays table columns, indexes, and triggers
- Workbench (Simplified): Shows only a table's columns
- Classic: Similar to the Workbench (Simplified) style showing only the table's columns
- IDEF1X: The ICAM DEFinition language information modeling style

The object notation style that you choose persists for the duration of your MySQL Workbench session and is saved along with your model. When MySQL Workbench is restarted, the object notation reverts to the default.

#### Note

If you plan to export or print an EER diagram be sure to decide on a notation style first. Changing notation styles after objects have been placed on a diagram can significantly change the appearance of the diagram.

#### The Relationship Notation Submenu

The items under the **Relationship Notation** submenu apply exclusively to an EER diagram. They are not enabled unless an EER diagram tab is selected.

The **Relationship Notation** submenu has these items:

- Crow's Foot (IE): The default modeling style. For an example, see Figure 9.24, "Adding Tables to the Canvas".
- Classic: Uses a diamond shape to indicate cardinality.
- Connect to Columns
- UML: Universal Modeling Language style.
- IDEF1X: The ICAM DEFinition language information modeling method

To view the different styles, set up a relationship between two or more tables and choose the different menu items.

The relationship notation style that you choose persists for the duration of your MySQL Workbench session and is saved along with your model. When MySQL Workbench is restarted, the relationship notation reverts to the default, the Crow's Foot style.

#### Note

If you plan to export or print an EER diagram, be sure to decide on a notation style first. Changing notation styles after objects have been placed on a diagram can significantly change the appearance of the diagram.

#### The Database Menu

This menu features actions against the connected MySQL server. The **Database** menu has these items:

- Query Database: Launches the SQL Editor, which enables you to create SQL code and execute it on a live server. For more information, see Section 8.1, "Visual SQL Editor".
- Manage Connections: Launches the Manage Server Connections dialog, which enables you to create
  and manage multiple connections. For more information, see Section 5.3, "Manage Server Connections"
- **Reverse Engineer**: Creates a model from an existing database. For more information, see Section 9.4.2.2, "Reverse Engineering a Live Database".
- **Forward Engineer**: Creates a database from a model. For more information, see Section 9.4.1.2, "Forward Engineering to a Live Server".
- Schema Transfer Wizard...: Executes the database migration wizard for MySQL databases. It is useful for moving from an older MySQL server to the latest MySQL version, and is meant for local development purposes. You should not use this tool on production MySQL instances as they often require more complex data migration techniques.

For additional information about this wizard, see MySQL Schema Transfer Wizard.

- **Migration Wizard...**: Executes the database migration wizard for most any database, and is meant to migrate tables and data from supported database systems to your MySQL server. For additional information, see Chapter 10, *Database Migration Wizard*.
- Edit Type Mappings for Generic Migration: From here you can define custom type mappings, such as migrating the source data type int8 to the target MySQL data type BIGINT.
- **Synchronize Model**: Synchronizes your database model with an existing database. For more information, see Section 9.5.1, "Database Synchronization".
- Synchronize with Any Source: Allows you to compare a target database or script with the open model, external script, or a second database, and apply these changes back to the target. For more information, see Section 9.5.1, "Database Synchronization".
- Compare Schemas: Compares your schema model with a live database or a script file. Section 9.5.2, "Compare and Report Differences in Catalogs".

### The Tools Menu

The **Tools** menu lists tools and utilities that related to MySQL Workbench usage.

- Browse Audit Log File: Launches a file browser to open a specific audit log file. MySQL Workbench prompts for sudo access if the MySQL Workbench user is unable to read the audit log file. For additional information about the Audit Inspector, see Section 6.6, "MySQL Audit Inspector Interface". Commercial Editions only.
- Configuration: Backup (or restore) your MySQL Connections, as defined in MySQL Workbench. Connection data is stored in a connections.xml file, for additional information about this file, see Section 3.3, "MySQL Workbench Settings and Log Files".

- **Utilities**: These utilities generate PHP code to either "Connect to the MySQL server" or "Iterate SELECT results", if applicable. For additional information about PHP code generation, see Section 8.1.11.2, "Generating PHP Code".
- Start Shell for MySQL Utilities: Opens the mysqluc MySQL Utility. For additional information about MySQL Utilities, see Appendix F, MySQL Utilities.

### The Scripting Menu

This menu features GRT scripting and plugin options. The **Scripting** menu has these items:

- **Scripting Shell**: Launches the MySQL Workbench Scripting Shell. For additional information, see Section C.5, "The Workbench Scripting Shell".
- New Script: Opens a New Script File dialogue, with options to create a Python Script, Python Plugin, or Python Module.
- Open Script: Opens a Open GRT Script dialogue, which defaults to the Workbench scripts directory. Files are opened into the Workbench Scripting Shell window.
- Run Script File: Executes the script that is currently open.
- Run Workbench Script File: Executes the specified script file.
- Install Plugin/Module File: Loads and installs a plugin or module file
- Plugin Manager: Displays information about the plugins that are installed, and allows disabling and uninstalling the plugins.

## The Help Menu

Use the **Help** menu when you require support, or when you want to help improve MySQL Workbench. This menu has the following items:

- **Help Index**: Opens a window showing a local copy of the MySQL Workbench documentation. Read, search, or print the documentation from this window.
- MySQL.com Website: Opens your default browser on the MySQL website home page.
- Workbench Product Page: Opens your default browser on the MySQL Workbench product page.
- System Info: Displays information about your system, which is useful when reporting a bug. For more information, see System Info.
- Report a Bug: Opens your default browser to bugs.mysql.com, and automatically fills in several fields
  such as the Operating System and MySQL Workbench version by passing in additional data via the
  GET request. The default "Description" requests you to also attach the Workbench log file. For additional
  information about reporting useful bug reports, see Appendix D, How To Report Bugs or Problems.
- View Reported Bugs: Opens your default browser to see a list of current bugs.
- Locate Log Files: Opens up the directory that contains the MySQL Workbench log files.
- Show Log File: Opens up the main MySQL Workbench log file in your default text editor. This file is typically named wb.log.
- Check For Updates: Checks if you are using the current MySQL Workbench version. If you are, then a popup informs you of this. If not, then a prompt asks you to open the MySQL Workbench download page.

About Workbench: Displays the MySQL Workbench About window. This also displays the MySQL Workbench version.

#### System Info

Use the **Help**, **System Info** menu item to display information about your system. This item is especially useful for determining your rendering mode. Sample output follows.

```

#### 9.1.1.2 The Toolbar

The MySQL Workbench toolbar is located immediately below the menu bar. Click the tools in the toolbar to perform the following actions:

- · The new document icon: Creates a new document
- The folder icon: Opens a MySQL Workbench file (mwb extension)
- The save icon: Saves the current MySQL Workbench project
- The right and left arrows: The left arrow performs an "Undo" operation. The right arrow performs a "Redo" operation.

Other tools appear on the toolbar depending upon the context.

#### **Tool-Specific Toolbar Items**

When an EER diagram canvas is selected, the following icons appear to the right of the arrow icons:

- · The toggle grid icon: Turns the grid on and off
- The grid icon: Aligns objects on the canvas with the grid
- The new EER diagram icon: Creates a new EER diagram tab.

The toolbar also changes depending upon which tool from the vertical toolbar is active. For discussion of these tools, see Section 9.1.2.1, "The Vertical Toolbar".

If the Table tool is active, schemata lists, engine types, and collations appear on the toolbar. The table properties can be modified using the Properties Editor.

When an object is selected, the object's properties, such as color, can be changed in the Properties Editor.

### 9.1.1.3 EER Diagrams

Use the Add new Diagram icon in the MySQL Model area to create EER diagrams. When you add an EER diagram, a new tab appears below the toolbar. Use this tab to navigate to the newly created EER diagram. For further discussion of EER Diagrams, see Section 9.1.2, "EER Diagram Editor".

## 9.1.1.4 The Physical Schemata Panel

The Physical Schemata panel of the MySQL Model page shows the active schemata and the objects that they contain.

Expand and contract the Physical Schemata section by double-clicking the arrow on the left of the Physical Schemata title bar. When the Physical Schemata section is expanded, it displays all currently loaded schemata.

Each schema shows as a tab. To select a specific schema, click its tab. When MySQL Workbench is first opened, a default schema, mydb, is selected. You can start working with this schema or you can load a new MySQL Workbench Model file (models use the .mwb extension.)

There are a variety of ways to add schema to the Physical Schemata panel. You can open an MWB file, reverse engineer a MySQL create script, or, if you are using a Commercial Edition of MySQL Workbench, you can reverse engineer a database by connecting to a MySQL server.

You can also add a new schema by clicking the + button on the top right of the Physical Schemata panel. To remove a schema, click its tab and use the - button found to the immediate left of the + button. To the left of these buttons are three buttons that control how database object icons are displayed:

- The left button displays database objects as large icons.
- The middle button displays small icons in multiple rows.
- · The right button displays small icons in a single list.

## The Schema Objects Panel

The Physical Schemata panel has the following sections:

- Tables
- Views
- Routines
- · Routine Groups

Each section contains the specified database objects and an icon used for creating additional objects.

Any database objects added to an EER diagram canvas also show up in the Physical Schemata section. For information about adding objects to an EER diagram canvas, see Section 9.1.2, "EER Diagram Editor".

## 9.1.1.5 The Schema Privileges Panel

The Schema Privileges panel has the following sections, used to create users for your schemata and to define roles —:

- Users
- Roles

The following figure displays the Schema Privileges section of the MySQL Model tab.

Figure 9.4 Roles and Privileges

## **Adding Roles**

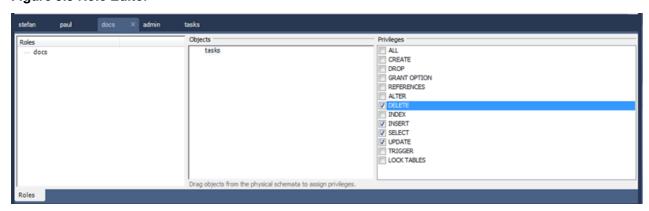

To add a role, double-click the **Add Role** icon. This creates a role with the default name role1. Right-clicking a role opens a pop-up menu with the following items:

- Cut 'role\_name': Cuts the role
- Copy 'role\_name': Copies the role
- Edit Role...: Opens the role editor
- Edit in New Window...: Opens the role editor in a new editor window
- Delete 'role\_name': Removes the role
- Copy SQL to Clipboard: Currently not implemented

To rename a role, click the role name. Then you will be able to edit the text.

All defined roles are listed under **Roles** on the left side of the role editor. Double-clicking a role object opens the role editor docked at the bottom of the page.

Figure 9.5 Role Editor

Select the role to which you wish to add objects. You may drag and drop objects from the Physical Schemas to the Objects section of the role editor. To assign privileges to a role, select it from the Roles section, then select an object in the Objects section. In the Privileges section, check the rights you wish to assign to this role. For example, a web\_user role might have only SELECT privileges and only for database objects exposed through a web interface. Creating roles can make the process of assigning rights to new users much easier.

## **Adding Users**

To add a user, double-click the Add User icon. This creates a user with the default name user1. Double-clicking this user opens the user editor docked at the bottom of the application.

In the User Editor, set the user's name and password using the **Name** and **Password** fields. Assign one role or a number of roles to the user by selecting the desired roles from the field on the right and then clicking the < button. Roles may be revoked by moving them in the opposite direction.

Right-clicking a user opens a pop-up menu. The items in the menu function as described in Adding Roles.

## 9.1.1.6 The SQL Scripts Panel

Use the SQL Scripts panel to attach SQL scripts to the model for documentation and organizational purposes, and optionally these attachments can be included in the output script when performing forward engineering or model/schema synchronization. The following figure shows the options available to customize the placement of attached SQL Scripts.

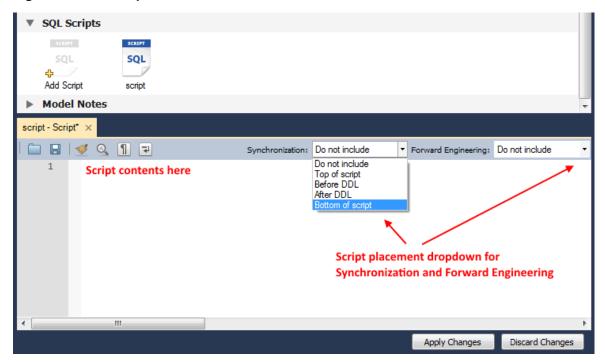

If you created your project from an SQL script and plan to create an ALTER script, you may want to add the original script here, because it will be needed to create an ALTER script. For more information, see Altering a Schema.

#### **Note**

The ability to use the attachments when performing forward engineering and synchronization was added in MySQL Workbench 6.2.0.

Figure 9.6 SQL Scripts Editor

#### 9.1.1.7 The Model Notes Panel

Use the Model Notes panel to write project notes. Any scripts or notes added will be saved with your project.

#### 9.1.1.8 The History Palette

Use the History palette to review the actions that you have taken. Left-clicking an entry opens a pop-up menu with the item, **Copy History Entries to Clipboard**. Choose this item to select a single entry. You

can select multiple contiguous entries by pressing the **Shift** key and clicking the entries you wish to copy. Select non-contiguous entries by using the **Control** key.

Only actions that alter the MySQL model or change an EER diagram are captured by the History palette.

## 9.1.1.9 The Model Navigator Panel

Docked at the top left of the application is the **Model Navigator**, or **Bird's Eye** panel. This panel provides an overview of the objects placed on an EER diagram canvas and for this reason it is most useful when an EER diagram is active. Any objects that you have placed on the canvas should be visible in the navigator.

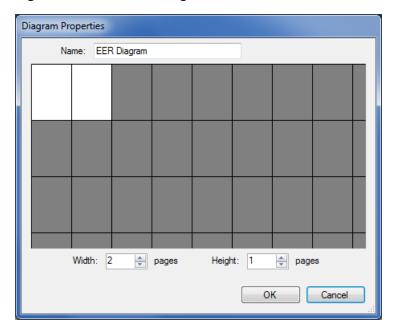

The Model Navigator shows the total area of an EER diagram (see the figure that follows). A black rectangular outline indicates the view port onto the visible area of the canvas. To change the view port of an EER diagram, left-click this black outline and drag it to the desired location. You can zoom in on selected areas of an EER diagram by using the slider tool at the bottom of this window. The dimensions of the view port change as you zoom in and out. If the slider tool has the focus, you can also zoom using the arrow keys.

Figure 9.7 The Model Navigator: Example

The default size of the Model Navigator is two pages. Use the **Model**, **Diagram Properties and Size** page to change the size and diagram name. The following figure shows an example of the Diagram Properties dialog.

**Figure 9.8 The Model Navigator Palette** 

## 9.1.1.10 The Catalog Tree Palette

The Catalog Tree palette shows all the schemata that are present in the Physical Schemata section of the MySQL Model page. Expand the view of the objects contained in a specific schema by clicking the > button to the left of the schema name. This displays the following folder icons:

- Tables
- Views
- Routine Groups

Expand each of these in turn by clicking the > button to the left of the folder icon.

The Catalog Tree palette is primarily used to drag and drop objects onto an EER diagram canvas.

You can toggle the sidebar on and off using the **Toggle Sidebar** button, which is located in the top right of the application.

## 9.1.1.11 The Layers Palette

This palette shows all of the layers and figures on an EER diagram. If a layer or figure is currently selected, an x appears beside the name of the object and its properties are displayed in the Properties palette. This is useful when determining the selected objects multiple objects were selected using the options under the **Select** menu item. For more information on this topic, see The Edit Menu.

Selecting an object in the Layers palette also adjusts the view port to the area of the canvas where the object is located.

#### Finding Invisible Objects Using the Layers Palette

In some circumstances, you may want to make an object on an EER diagram invisible. Select the object and, in the Properties palette, set the visible property to False.

The Layer palette provides an easy way to locate an object, such as a relationship, that has been set to hidden. Open the Layers palette and select the object by double-clicking it. You can then edit the object and change its visibility setting to Fully Visible.

## 9.1.1.12 The Properties Palette

The Properties palette is used to display and edit the properties of objects on an EER diagram. It is especially useful for editing display objects such as layers and notes.

Selecting an object in the EER diagram displays its properties in the Properties palette.

All objects except connections have the following properties except as noted:

- color: The color accent of the object, displayed as a hexadecimal value. Change the color of the object by changing this value. Only characters that are legal for hexadecimal values may be entered. You can also change the color by clicking the ... button to open a color changing dialog box.
- description: Applicable to layers only. A means of documenting the purpose of a layer.
- expanded: This attribute applies to objects such as tables that can be expanded to show columns, indexes, and triggers.
- height: The height of the object. Depending upon the object, this property may be read only or read/ write.
- left: The number of pixels from the object to the left side of the canvas.
- locked: Whether the object is locked. The value for this attribute is either true or false.
- manualSizing: Whether the object was manually sized. The value for this attribute is either true or false.
- name: The name of the object.
- top: The number of pixels from the object to the top of the canvas.
- visible: Whether the object shows up on the canvas. Use '1' for true and '0' for false. It is currently used only for relationships.
- width: The width of the object. Depending upon the object, this property may be read only or read/write.

Tables have the following additional properties:

- indexesExpanded: Whether indexes are displayed when a table is placed on the canvas. Use '1' for true and '0' for false.
- triggersExpanded: Whether triggers are displayed when a table is placed on the canvas. Use `1' for true and `0' for false.

For a discussion of connection properties, see Section 9.1.4.3, "Connection Properties".

# 9.1.2 EER Diagram Editor

EER diagrams are created by double-clicking the Add Diagram icon. You may create any number of EER diagrams just as you may create any number of physical schemas (databases). Each EER diagram shows as a tab below the toolbar; a specific EER diagram is selected by clicking its tab.

Clicking an EER diagram tab navigates to the canvas used for graphically manipulating database objects. The Vertical Toolbar is on the left side of this page.

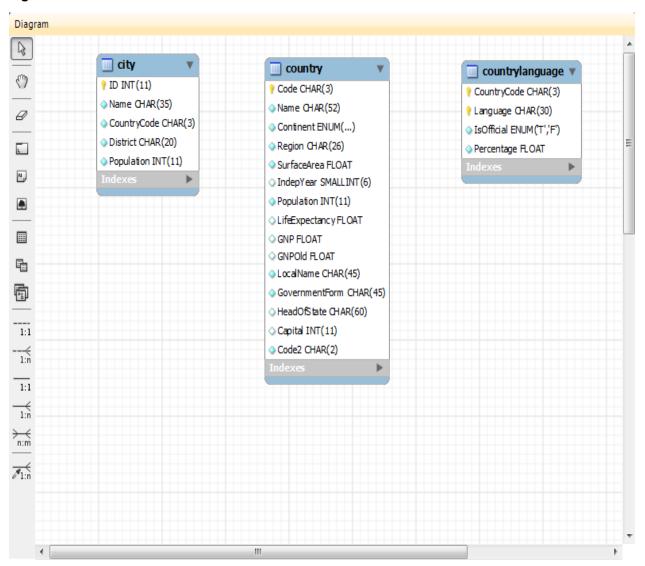

#### Note

This tool is for creating and editing EER diagrams for a model. To edit an existing database, either reverse engineer the database to create a model, or synchronize your model to a database. For additional information, see Section 9.4.2.2, "Reverse Engineering a Live Database" and Section 9.5, "Schema Synchronization and Comparison".

## 9.1.2.1 The Vertical Toolbar

The vertical toolbar appears on the left sidebar (see the following figure) when an EER diagram tab is selected. The tools on this toolbar assist in creating EER diagrams.

Figure 9.9 The Vertical Toolbar

Clicking a tool changes the mouse pointer to a pointer that resembles the tool icon, indicating which tool is active. These tools can also be activated from the keyboard by pressing the key associated with the tool. Hover the mouse pointer over a toolbar icon to display a description of the tool and its shortcut key.

A more detailed description of each of these tools follows.

## **The Standard Mouse Pointer**

The standard mouse pointer, located at the top of the vertical toolbar, is the default mouse pointer for your operating system. Use this tool to revert to the standard mouse pointer after using other tools.

To revert to the default pointer from the keyboard, use the **Esc** key.

#### **The Hand Tool**

The hand tool is used to move the entire EER diagram. Left-click on this tool and then left-click anywhere on the EER diagram canvas. Moving the mouse while holding down the mouse button changes the view port of the canvas.

To determine your position on the canvas, look at the Model Navigator panel on the upper right. If the Model Navigator panel is not open, use **View**, **Windows**, **Model Navigator** to open it.

To activate the hand tool from the keyboard, use the **H** key.

You can also change the view port of an EER diagram using the Model Navigator panel. See Section 9.1.1.9, "The Model Navigator Panel".

#### The Eraser Tool

Use the eraser tool to delete objects from the EER Diagram canvas. Change the mouse pointer to the eraser tool, then click the object you wish to delete. Depending upon your settings, the delete dialog box should open, asking you to confirm the type of deletion.

#### Note

The delete action of the eraser tool is controlled by the general option setting for deletion. Before using the eraser tool, be sure that you understand the available options described in Section 3.2.4, "Modeling Preferences".

To activate the eraser tool from the keyboard, use the **D** key.

You can also delete an object by selecting it and pressing **Control+Delete** or by right-clicking it and choosing **Delete** from the pop up menu.

## The Layer Tool

The layer tool is the rectangular icon with a capital  ${\tt L}$  in the lower left corner. Use the layer tool to organize the objects on an EER Diagram canvas. It is useful for grouping similar objects. For example, you may use it to group all your views.

Click the layer tool and use it to draw a rectangle on the canvas. Change to the standard mouse pointer tool and pick up any objects you would like to place on the newly created layer.

To change the size of a layer, first select it by clicking it. When a layer is selected, small rectangles appear at each corner and in the middle of each side. Adjust the size by dragging any of these rectangles.

You can also make changes to a layer by selecting the layer and changing properties in the Properties panel. Using the Properties panel is the only way to change the name of a layer.

To activate the layer tool from the keyboard, use the **L** key. For more information about layers, see Section 9.1.7, "Creating Layers".

#### The Text Tool

The text tool is the square icon with a capital  $\mathbb{N}$  in the top left corner. Use this tool to place text objects on the EER diagram canvas. Click the tool, then click the desired location on the canvas. After a text object has been dropped on the canvas, the mouse pointer reverts to its default.

To add text to a text object, right-click the text object and choose **Edit Note...** or **Edit in New Window...** from the pop-up menu.

You can manipulate the properties of a text object by selecting it and then changing its properties in the Properties panel.

To activate the text tool from the keyboard, use the  $\bf N$  key. For more information about text objects, see Section 9.1.9, "Creating Text Objects".

## The Image Tool

Use the image tool to place an image on the canvas. When this tool is selected and you click the canvas, a dialog box opens enabling you to select the desired graphic file.

To activate the image tool from the keyboard, use the I key. For more information about images, see Section 9.1.10, "Creating Images".

#### The Table Tool

Use this tool to create a table on the EER Diagram canvas.

Clicking the canvas creates a table. To edit the table with MySQL Table Editor, right-click it and choose **Edit Table...** or **Edit in New Window...** from the pop-up menu. You can also double-click the table to load it into the table editor.

To activate the table tool from the keyboard, use the **T** key.

For more information about creating and editing tables, see Section 8.1.10, "The MySQL Table Editor".

#### The View Tool

Use this tool to create a view on an EER Diagram canvas. When the table tool is activated, a schema list appears on the toolbar below the main menu, enabling you to associate the new view with a specific schema. You can also select a color for the object by choosing from the color list to the right of the schema list.

After selecting this tool, clicking the canvas creates a new view. To edit this view, right-click it and choose **Edit View...** or **Edit in New Window...** from the pop-up menu.

To activate the view tool from the keyboard, use the **V** key.

For more information about creating and editing views, see Section 9.1.5, "Creating Views".

#### The Routine Group Tool

Use this tool to create a routine group on the EER Diagram canvas. When this tool is activated, a schema list appears on the toolbar below the main menu, enabling you to associate the routine group with a specific schema. You can also select a color for the routine group by choosing from the color list to the right of the schema list.

After selecting this tool, clicking the canvas creates a new group. To edit this view, right-click it and choose **Edit Routine Group...** or **Edit in New Window...** from the pop-up menu.

To activate the routine group tool from the keyboard, use the **G** key.

For more information about creating and editing routine groups, see Section 9.1.6.2, "Routine Groups".

#### The Relationship Tools

The five relationship tools are used to represent the following relationships:

- · One-to-many non-identifying relationships
- One-to-one non-identifying relationships
- · One-to-many identifying relationships
- One-to-one identifying relationships
- Many-to-many identifying relationships

These tools appear at the bottom of the vertical tool bar. Hover the mouse pointer over each tool to see a text hint that describes its function.

For more information about relationships, see Section 9.1.4, "Creating Foreign Key Relationships".

# 9.1.3 Creating Tables

## 9.1.3.1 Adding Tables to the Physical Schemas

Double-clicking the **Add table** icon in the **Physical Schemas** section of the **Model Overview** tab adds a table with the default name of table1. If a table with this name already exists, the new table is named table2.

Adding a new table automatically opens the table editor docked at the bottom of the application. For information about using the table editor, see Section 8.1.10, "The MySQL Table Editor".

Right-clicking a table opens a context menu with the following items:

- Cut 'table\_name': Cut a table to optionally paste it into another schema.
- **Copy** 'table\_name': Copy a table to optionally paste it into another schema.
- Paste 'table\_name': Paste a cut or copied table. The Paste option is also accessible from the main Edit menu.
- Edit 'table\_name': Changes the docked table editor to the selected table.
- Edit 'table\_name' in New Tab: Opens the table in a new table editor tab.
- Copy SQL to Clipboard: Copies a CREATE TABLE statement for the table.
- Copy Column Names to Clipboard: Copies a comma-separated list of column names.
- Copy Insert to Clipboard: Copies INSERT statements based on the model's inserts. Nothing is copied to the clipboard if the table has no inserts defined.
- Copy Insert Template to Clipboard: Copies a generic INSERT statement that is based on the model.
- Delete 'table\_name': Remove a table from the database.

#### Warning

This immediately deletes the table without a confirmation dialog box.

• Remove Figure 'table\_name': If applicable, remove the figure associated with the table.

If the table editor is not open, the **Edit 'table\_name'** item opens it. If it is already open, the selected table replaces the previous one. **Edit 'table\_name'** in **New Tab** opens an additional table editor tab.

Any tables added to the Physical Schemas section also show up in the **Catalog Tree** palette within the **EER Diagram** tab. They may be added to an EER Diagram by dragging and dropping them from this palette.

## 9.1.3.2 Adding Tables to an EER Diagram

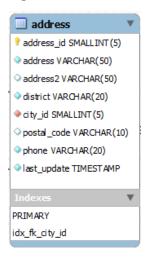

Tables can also be added to an EER Diagram using the table tool on the vertical toolbar. Make sure that the **EER Diagram** tab is selected, then right-click the table icon on the vertical toolbar. The table icon is the rectangular tabular icon.

Clicking the mouse on this icon changes the mouse pointer to a table pointer. You can also change the mouse pointer to a table pointer by pressing the **T** key.

Choosing the table tool changes the contents of the toolbar that appears immediately below the menu bar. When the Tables pointer is active, this toolbar contains a schemas list, an engines list, a collations list, and a color chart list. Use these lists to select the appropriate schema, engine, collation, and color accent for the new table. Make sure that you associate the new table with a database. The engine and collation of a table can be changed using the table editor. The color of your table can be changed using the Properties palette. The Default Engine and Default Collation values refer to the database defaults.

Create a table by clicking anywhere on the EER Diagram canvas. This action creates a new table with the default name table1. To revert to the default mouse pointer, click the arrow icon at the top of the vertical toolbar.

Figure 9.10 A Table on an EER Diagram

As shown in the preceding figure, the primary key is indicated by a key icon and indexed fields are indicated by a different colored diamond icon. Click the arrow to the right of the table name to toggle the display of the fields. Toggle the display of indexes and triggers in the same way.

Right-clicking a table opens a pop-up menu with the following items:

- Cut 'table\_name'
- Copy 'table\_name'
- Paste
- Edit 'table name'
- Edit 'table name' in New Tab...
- Copy SQL to Clipboard
- Copy Column Names to Clipboard
- · Copy Inserts to Clipboard
- Copy Insert Template to Clipboard
- Delete 'table name'

### • Remove Figure 'table\_name'

With the exception of the deletion item, these menu items function as described in Section 9.1.3.1, "Adding Tables to the Physical Schemas". The behavior of the delete option is determined by your MySQL Workbench options settings. For more information, see Section 3.2.4, "Modeling Preferences".

# 9.1.4 Creating Foreign Key Relationships

Foreign key constraints are supported for the InnoDB storage engine only. For other storage engines, the foreign key syntax is correctly parsed but not implemented. For more information, see Foreign Key Differences.

Using MySQL Workbench you may add a foreign key from within the table editor or by using the relationship tools on the vertical toolbar of an EER Diagram. This section deals with adding a foreign key using the foreign key tools. To add a foreign key using the table editor, see Section 8.1.10.4, "The Foreign Keys Tab".

The graphical tools for adding foreign keys are most effective when you are building tables from the ground up. If you have imported a database using an SQL script and need not add columns to your tables, you may find it more effective to define foreign keys using the table editor.

## 9.1.4.1 Adding Foreign Key Relationships Using an EER Diagram

The vertical toolbar on the left side of an EER Diagram has six foreign key tools:

- one-to-one non-identifying relationship
- one-to-many non-identifying relationship
- one-to-one identifying relationship
- one-to-many identifying relationship
- many-to-many identifying relationship
- Place a Relationship Using Existing Columns

#### Differences include:

• An identifying relationship: identified by a solid line between tables

An identifying relationship is one where the child table cannot be uniquely identified without its parent. Typically this occurs where an intermediary table is created to resolve a many-to-many relationship. In such cases, the primary key is usually a composite key made up of the primary keys from the two original tables.

A non-identifying relationship: identified by a broken (dashed) line between tables

Create or drag and drop the tables that you wish to connect. Ensure that there is a primary key in the table that will be on the "one" side of the relationship. Click on the appropriate tool for the type of relationship you wish to create. If you are creating a one-to-many relationship, first click the table that is on the "many" side of the relationship, then on the table containing the referenced key. This creates a column in the table on the many side of the relationship. The default name of this column is table\_name\_key\_name where the table name and the key name both refer to the table containing the referenced key.

When the many-to-many tool is active, double-clicking a table creates an associative table with a many-to-many relationship. For this tool to function there must be a primary key defined in the initial table.

Use the **Model** menu, **Menu Options** menu item to set a project-specific default name for the foreign key column (see The Relationship Notation Submenu). To change the global default, see Section 3.2.4, "Modeling Preferences".

To edit the properties of a foreign key, double-click anywhere on the connection line that joins the two tables. This opens the relationship editor.

Pausing your mouse pointer over a relationship connector highlights the connector and the related keys as shown in the following figure. The film and the film\_actor tables are related on the film\_id field and these fields are highlighted in both tables. Since the film\_id field is part of the primary key in the film\_actor table, a solid line is used for the connector between the two tables. After pausing over a relationship for a second, a yellow box is displayed that provides additional information.

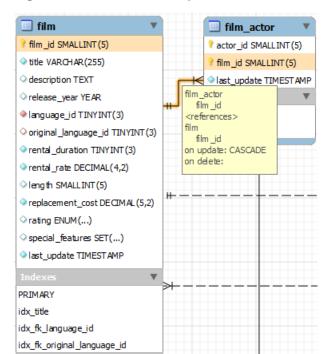

Figure 9.11 The Relationship Connector

If the placement of a connection's caption is not suitable, you can change its position by dragging it to a different location. If you have set a secondary caption, its position can also be changed. For more information about secondary captions, see Section 9.1.4.3, "Connection Properties". Where the notation style permits, Classic for example, the cardinality indicators can also be repositioned.

The relationship notation style in Figure 9.11, "The Relationship Connector" is the default, crow's foot. You can change this if you are using a Commercial Edition of MySQL Workbench. For more information, see The Relationship Notation Submenu.

You can select multiple connections by holding down the **Control** key as you click a connection. This can be useful for highlighting specific relationships on an EER diagram.

## 9.1.4.2 The Relationship Editor

Double-clicking a relationship on the EER diagram canvas opens the relationship editor. This has two tabs: **Relationship**, and **Foreign Key**.

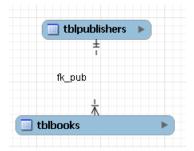

## **Relationship Tab**

In the **Relationship** tab, you can set the caption of a relationship using the **Caption** field. This name displays on the canvas and is also the name used for the constraint itself. The default value for this name is fk\_source\_table\_destination\_table. Use the **Model** menu, **Menu Options** menu item to set a project-specific default name for foreign keys. To change the global default, see Section 3.2.4, "Modeling Preferences".

You can also add a secondary caption and a caption to a relationship.

The **Visibility Settings** section is used to determine how the relationship is displayed on the EER Diagram canvas. Fully Visible is the default but you can also choose to hide relationship lines or to use split lines. The split line style is shown in the following figure.

Figure 9.12 The Split Connector

#### Note

A broken line connector indicates a non-identifying relationship. The split line style can be used with either an identifying relationship or a non-identifying relationship. It is used for display purposes only and does not indicate anything about the nature of a relationship.

To set the notation of a relationship use the **Model** menu, **Relationship Notation** menu item. For more information, see The Relationship Notation Submenu.

## Foreign Key Tab

The Foreign Key tab contains several sections: Referencing Table, Cardinality and Referenced Table.

The **Mandatory** check boxes are used to select whether the referencing table and the referenced table are mandatory. By default, both of these constraints are true (indicated by the check boxes being checked).

The **Cardinality** section has a set of radio buttons that enable you to choose whether the relationship is one-to-one or one-to-many. There is also a check box that enables you to specify whether the relationship is an identifying relationship.

# 9.1.4.3 Connection Properties

Right-click a connection to select it. When a connection is selected, it is highlighted and its properties are displayed in the properties palette. Connection properties are different from the properties of other objects. The following list describes them:

- caption: The name of the connection. By default, the name is the name of the foreign key and the property is centered above the connection line.
- captionXOffs: The X offset of the caption.

- captionYOffs: The Y offset of the caption.
- comment: The comment associated with the relationship.
- drawSplit: Whether to show the relationship as a continuous line.
- endCaptionXOffs: The X termination point of the caption offset.
- endCaptionYOffs: The Y termination point of the caption offset.
- extraCaption: A secondary caption. By default, this extra caption is centered beneath the connection line.
- extraCaptionXOffs: The X offset of the secondary caption.
- extraCaptionYOffs: The Y offset of the secondary caption.
- mandatory: Whether the entities are mandatory. For more information, see Section 9.1.4.2, "The Relationship Editor".
- many: False if the relationship is a one-to-one relationship.
- middleSegmentOffset: The offset of the middle section of the connector.
- modelOnly: Set when the connection will not be propagated to the DDL. It is just a logical connection drawn on a diagram. This is used, for example, when drawing MyISAM tables with a visual relationship, but with no foreign keys.
- name: The name used to identify the connection on the EER Diagram canvas. Note that this is not the name of the foreign key.
- referredMandatory: Whether the referred entity is mandatory.
- startCaptionXOffs: The start of the X offset of the caption.
- startCaptionYOffs: The start of the Y offset of the caption.

In most cases, you can change the properties of a relationship using the relationship editor rather than the Properties palette.

If you make a relationship invisible by hiding it using the relationship editor's **Visibility Settings**, and then close the relationship editor, you will no longer be able to select the relationship to bring up its relationship editor. To make the relationship visible again, you must expand the table object relating to the relationship in the **Layers** palette and select the relationship object. To edit the selected object, right-click it, then select **Edit Object**. You can then set the **Visibility Settings** to **Fully Visible**. The relationship will then be visible in the **EER Diagram** window.

# 9.1.5 Creating Views

You can add views to a database either from the Physical Schemas section of the MySQL Model page or from the EER Diagram.

## 9.1.5.1 Adding Views to the Physical Schemas

To add a view, double-clicking the Add View icon in the Physical Schemas section of the MySQL Model page. The default name of the view is view1. If a view with this name already exists, the new view is named view2.

Adding a new view automatically opens the view editor docked at the bottom of the application. For information about using the view editor, see Section 9.1.5.3, "The View Editor".

Right-clicking a view opens a pop-up menu with the following items:

• Cut 'view name'

The 'view\_name' is only cut from the EER canvas, and not removed from the schema.

- Copy 'view\_name'
- Paste
- Edit View...
- · Edit in New Window...
- Copy SQL to Clipboard
- **Delete 'view\_name'**: deletes from both the EER canvas and schema.
- Remove 'view\_name': deletes from the EER canvas, but not the schema.

If the table editor is not open, the **Edit View...** item opens it. If it is already open, the selected table replaces the previous one. **Edit in New Window...** opens a new view editor tab.

The cut and copy items are useful for copying views between different schemas. **Copy SQL to Clipboard** copies the CREATE VIEW statement to the clipboard.

#### Warning

Use the **Delete 'view\_name'** item to remove a view from the database. There will be **no** confirmation dialog box.

Any views added to the Physical Schemas section also show up in the Catalog palette on the left side of the application. They may be added to an EER Diagram, when in the EER Diagram tab, by dragging and dropping them from this palette.

## 9.1.5.2 Adding Views to an EER Diagram

Views can also be added to an EER Diagram using the View tool on the vertical toolbar. Make sure that the **EER Diagram** tab is selected, then left-click the view icon on the vertical toolbar. The view icon is the two overlapping rectangles found below the table icon.

Clicking this icon changes the mouse pointer to a view pointer. To change the mouse pointer to a view pointer from the keyboard, use the **V** key.

Choosing the View tool changes the contents of the toolbar that appears immediately below the main menu bar. When the Views pointer is active, this toolbar contains a schemas list and a color chart list. Use these lists to select the appropriate schema and color accent for the new view. Make sure that you associate the new view with a database. The color of your view can be changed using the Properties palette.

Create a view by clicking anywhere on the EER Diagram canvas. This creates a new view with the default name view1. To revert to the default mouse pointer, click the arrow icon at the top of the vertical toolbar.

Right-clicking a view opens a pop-up menu. With the exception of the delete item, these menu items function as described in Section 9.1.5.1, "Adding Views to the Physical Schemas". The behavior of the

delete option is determined by your MySQL Workbench options settings. For more information, see Section 3.2.4, "Modeling Preferences".

#### 9.1.5.3 The View Editor

To invoke the view editor, double-click a view object on the EER Diagram canvas or double-click a view in the Physical Schemas section on the MySQL Model page. This opens the view editor docked at the bottom of the application. Double-clicking the title bar undocks the editor. Do the same to redock it. Any number of views may be open at the same time. Each additional view appears as a tab at the top of the view editor.

There are three tabs at the bottom of the view editor: **View**, **Comments**, and **Privileges**. Navigate between different tabs using the mouse or from the keyboard by pressing **Control+Alt+Tab**.

#### The View Tab

Use the View tab to perform the following tasks:

- Rename the view using the Name text box.
- Enter the SQL to create a view using the SQL field.
- Comment a view using the Comments text area.

#### **The Comments Tab**

This tab enables you to enter comments for a particular view.

#### The Privileges Tab

The **Privileges** tab of the view editor functions in exactly the same way as the **Privileges** tab of the routine editor. For more information, see The Privileges Tab.

## 9.1.5.4 Modifying a View Using the Properties Palette

When you select a view on the EER Diagram canvas, its properties are displayed in the Properties palette. Most of the properties accessible from the Properties palette apply to the appearance of a view on the EER Diagram canvas.

For a list of properties accessible through the Properties palette, see Section 9.1.1.12, "The Properties Palette".

# 9.1.6 Creating Routines and Routine Groups

You can add Routine Groups to a database either from the **Physical Schemata** section of the **MySQL Model** page or from an EER Diagram. Routines may be added only from the **Physical Schemata** section of the **MySQL Model** page.

To view an existing schema, along with its Routines and Routine Groups, choose **Database**, **Reverse Engineer...** from the main menu. After the schema has been added to the current model, you can see the schema objects on the **Physical Schemata** panel on the **MySQL Model** page. The Routines and Routine Groups are listed there.

MySQL Workbench unifies both stored procedures and stored functions into one logical object called a Routine. **Routine Groups** are used to group related routines. Define Routine with the **Routine Group Editor** to assign specific routines to a group, using a drag and drop interface.

When designing an EER Diagram, you can place the Routine Groups on the canvas by dragging them from the **Catalog Palette**. Placing individual routines on the diagram is not permitted, as it would clutter the canvas.

#### **9.1.6.1 Routines**

### Adding Routines to the Physical Schemata

To add a routine, double-click the Add Routine icon in the Physical Schemata section of the MySQL Model page. The default name of the routine is routine1. If a routine with this name already exists, the new routine is named routine2.

Adding a new routine automatically opens the routine editor docked at the bottom of the application. For information about using the routine editor, see The Routine Editor.

Right-clicking a routine opens a pop-up menu with the following items:

- Rename
- Cut 'routine\_name'
- Copy 'routine\_name'
- Paste
- Edit Routine...
- · Edit in New Window...
- Copy SQL to Clipboard
- Delete 'routine\_name'

The **Edit Routine...** item opens the routine editor.

The cut and paste items are useful for copying routines between different schemata.

#### Note

Deleting the code for a routine from the **Routines** tab of the Routine Group Editor results in removal of the routine object from the model.

#### Note

To remove a routine from a routine group, use the controls on the **Routine Group** tab of the Routine Group Editor.

The action of the delete option varies depending upon how you have configured MySQL Workbench. For more information, see Section 3.2.4, "Modeling Preferences".

#### The Routine Editor

To invoke the routine editor, double-click a routine in the Physical Schemata section on the MySQL Model page. This opens the routine editor docked at the bottom of the application. Any number of routines may be open at the same time. Each additional routine appears as a tab at the top of the routine editor.

**Routine** and **Privileges** tabs appear at the bottom of the routine editor. Navigate between different tabs using the mouse or from the keyboard by pressing **Control+Alt+Tab**.

#### The Routine Tab

Use the **Routine** tab of the routine editor to perform the following tasks:

- · Rename the routine using the Name field.
- Enter the SQL to create a routine using the SQL field.

#### The Privileges Tab

The **Privileges** tab of the routine editor allows you to assign specific roles and privileges. You may also assign privileges to a role using the role editor. For a discussion of this topic, see Adding Roles.

When this tab is first opened, all roles that have been created are displayed in the list on the right. Move the roles you wish to associate with this table to the **Roles** list on the left. Do this by selecting a role and then clicking the < button. Use the **Shift** key to select multiple contiguous roles and the **Control** key to select noncontiguous roles.

To assign privileges to a role, click the role in the **Roles** list. This displays all available privileges in the **Assigned Privileges** list. The privileges that display are:

- ALL
- CREATE
- DROP
- GRANT OPTION
- REFERENCES
- ALTER
- DELETE
- INDEX
- INSERT
- SELECT
- UPDATE
- TRIGGER

You can choose to assign all privileges to a specific role or any other privilege as listed previously. Privileges irrelevant to a specific table, such as the FILE privilege, are not shown.

If a role has already been granted privileges on a specific table, those privileges show as already checked in the **Assigned Privileges** list.

## 9.1.6.2 Routine Groups

## **Adding Routine Groups to the Physical Schemata**

Double-clicking the Add Routine Group icon in the Physical Schemata section of the MySQL Model page adds a routine group with the default name of routines1. If a routine group with this name already exists, the new routine group is named routines2.

Adding a new routine group automatically opens the routine groups editor docked at the bottom of the application. For information about using the routine groups editor, see The Routine Group Editor.

Right-clicking a routine group opens a pop-up menu with the following items:

- Rename
- Cut 'routine group name'
- Copy 'routine group name'
- Edit Routine...
- . Edit in New Window...
- · Copy SQL to Clipboard
- Delete 'routine group name'

The **Edit Routine Group...** item opens the routine group editor, which is described in The Routine Group Editor.

The cut and paste items are useful for copying routine groups between different schemata.

Deleting a routine group from the MySQL Model page removes the group but does not remove any routines contained in that group.

Any routine groups added to the Physical Schemata also show up in the Catalog palette on the right side of the application. They may be added to an EER diagram by dragging and dropping them from this palette.

#### Adding Routine Groups to an EER Diagram

To add routine groups to an EER Diagram, use the Routine Groups tool on the vertical toolbar. Make sure that the **EER Diagram** tab is selected, then right-click the routine groups icon on the vertical toolbar. The routine groups icon is immediately above the lowest toolbar separator.

Clicking the mouse on this icon changes the mouse pointer to a routine group pointer. You can also change the mouse pointer to a routine pointer by pressing the **G** key.

Choosing the Routine Group tool changes the contents of the toolbar that appears immediately below the menu bar. When the Routine Groups pointer is active, this toolbar contains a schemata list and a color chart list. Use these lists to select the appropriate schema and color accent for the new routine group. Make sure that you associate the new routine group with a database. The color of your routine group can be changed later using the Properties palette.

Create a routine group by clicking anywhere on the EER Diagram canvas. This creates a new routine group with the default name routines1. To revert to the default mouse pointer, click the arrow icon at the top of the vertical toolbar.

Right-clicking a routine group opens a pop-up menu. With the exception of the delete option and rename options, these menu options function as described in Adding Routine Groups to the Physical Schemata. There is no rename option, and the behavior of the delete option is determined by your MySQL Workbench options settings. For more information, see Section 3.2.4, "Modeling Preferences".

## **The Routine Group Editor**

To invoke the routine group editor, double-click a routine group object on the EER Diagram canvas or double-click a routine group in the Physical Schemata section on the MySQL Model page. This opens

the routine group editor docked at the bottom of the application. Double-clicking the title bar undocks the editor. Do the same to redock it. Any number of routine groups may be open at the same time. Each additional routine group appears as a tab at the top of the routine editor,

**Routine group** and **Privileges** tabs appear at the bottom of the routine editor. Navigate between different tabs using the mouse or from the keyboard by pressing **Control+Alt+Tab**.

#### The Routine Groups Tab

Use the Routine Groups tab of the routine groups editor to perform the following tasks:

- · Rename the routine group using the Name field.
- Add routines to the group by dragging and dropping them.
- · Add comments to the routine group.

#### The Privileges Tab

The **Privileges** tab of the routine group editor functions in exactly the same way as the **Privileges** tab of the table editor. For more information, see The Privileges Tab.

#### Modifying a Routine Group Using the Properties Palette

When you select a routine group on the EER Diagram canvas, its properties are displayed in the Properties palette. All of the properties accessible from the Properties palette apply to the appearance of a routine group on the EER Diagram canvas.

For a list of properties accessible through the Properties palette, see Section 9.1.1.12, "The Properties Palette".

# 9.1.7 Creating Layers

You can add layers to a database only from an EER Diagram. Layers are used to help organize objects on the canvas. Typically, related objects are added to the same layer; for example, you may choose to add all your views to one layer.

# 9.1.7.1 Adding Layers to an EER Diagram

To add layers to an EER Diagram, use the Layer tool on the vertical toolbar. Select an **EER Diagram** tab and left-click the layer icon on the vertical toolbar. The layer icon is the rectangle with an `L' in the lower left corner and it is found below the eraser icon.

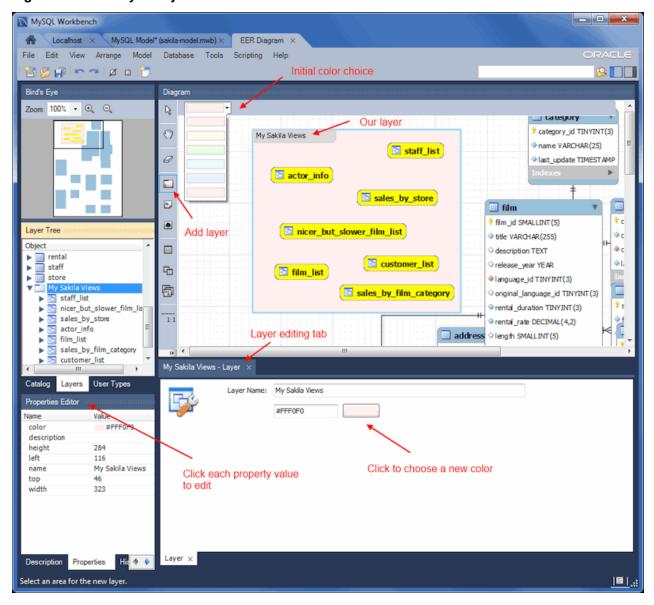

Clicking the mouse on this icon changes the mouse pointer to a layer pointer. You can also change the mouse pointer to a layer pointer by pressing the  $\mathbf{L}$  key.

Choosing the Layer tool changes the contents of the toolbar that appears immediately below the menu bar. When the Layers pointer is active, this toolbar contains a color chart list. Use this list to select the color accent for the new layer. The color of your layer can be changed later using the Properties palette.

Create a layer by clicking anywhere on the EER Diagram canvas and, while holding the left mouse button down, draw a rectangle of a suitable size. This creates a new layer with the default name layer1. To revert to the default mouse pointer, click the arrow icon at the top of the vertical toolbar.

The following figure shows a layer named "My Sakila Views" with several views:

Figure 9.13 The Layer Object

To open the layer editor, either double-click the layer or right-click the layer and choose the edit option. The available context-menu options are:

- Cut 'layer\_name'
- Copy 'layer\_name'
- Paste 'a table name'
- Edit 'layer\_name'
- Delete 'layer\_name'

## Note

A layer may also be edited via **Properties Editor** on the left panel, and it offers additional edit options.

The cut and copy items are useful for copying layers between different schemata.

Since layers are not schema objects, no confirmation dialog box opens when you delete a layer regardless of how you have configured MySQL Workbench. Deleting a layer does **not** delete schema objects from the catalog.

## Adding Objects to a Layer

To add an object to a layer, drag and drop it directly from the Catalog palette onto a layer. If you pick up an object from an EER diagram, you must press **Control** as you drag it onto the layer, otherwise it will not be "locked" inside the layer.

Locking objects to a layer prevents their accidental removal. You cannot remove them by clicking and dragging; to remove an object, you also must press the **Control** key while dragging it.

As a visual cue that the object is being "locked", the outline of the layer is highlighted as the object is dragged over it.

If you drag a layer over a table object, the table object will automatically be added to the layer. This also works for multiple table objects.

Layers cannot be nested. That is, a layer cannot contain another layer object.

## 9.1.7.2 Modifying a Layer Using the Properties Palette

Choosing "Edit" allows you to edit the layer name and layer background color, and the "Properties Editor" offers additional edit options.

When you select a layer on the EER Diagram canvas, its properties are displayed in the Properties palette. The properties accessible from the Properties palette apply to the appearance of a layer on the EER Diagram canvas.

In some circumstances, you may want to make a layer invisible. Select the layer and, in the Properties palette, set the visible property to False. To locate an invisible object, open the Layers palette and select the object by double-clicking it. After an object is selected, you can reset the visible property from the Properties palette.

For a list of properties accessible through the Properties palette, see Section 9.1.1.12, "The Properties Palette". In addition to the properties listed there, a layer also has a description property. Use this property to document the purpose of the layer.

# 9.1.8 Creating Notes

You can add notes to a database only from the Model Notes section of the MySQL Model page. Notes are typically used to help document the design process.

# 9.1.8.1 Adding Notes

Double-clicking the Add Note icon in the Model Notes section of the MySQL Model page adds a note with the default name of note1. If a note with this name already exists, the new note is named note2.

Adding a new note automatically opens the note editor docked at the bottom of the application. For information about using the note editor, see Section 9.1.8.2, "The Note Editor".

Right-clicking a note opens a pop-up menu with the following items:

### Rename

- Cut 'note\_name'
- Copy 'note\_name'
- Delete 'note\_name'

The **Edit Note...** item opens the note editor. For information about using the note editor, see Section 9.1.8.2, "The Note Editor".

The cut and copy items are useful for copying notes between different schemata.

Notes can be added only on the MySQL Model page.

## 9.1.8.2 The Note Editor

To invoke the note editor, double-click a note object in the Model Note section on the MySQL Model page. This opens the note editor docked at the bottom of the application. Double-clicking the note tab undocks the editor. Double-click the title bar to redock it. Any number of notes may be open at the same time. Each additional note appears as a tab at the top of the note editor.

Use the editor to change the name of a note or its contents.

# 9.1.9 Creating Text Objects

Text objects are applicable only to an EER diagram. They can be used for documentation purposes; for example, to explain a grouping of schema objects. They are also useful for creating titles for an EER diagram should you decide to export a diagram as a PDF or PNG file.

## 9.1.9.1 Adding Text Objects to an EER Diagram

To add text objects to an EER Diagram, use the Text Object tool on the vertical toolbar. Make sure that the **EER Diagram** tab is selected, then right-click the text object icon on the vertical toolbar. The text object icon is the rectangular icon found below the label icon.

Clicking the mouse on this icon changes the mouse pointer to a text object pointer. You can also change the mouse pointer to a text object pointer by pressing the **N** key.

Choosing the Text Object tool changes the contents of the toolbar that appears immediately below the menu bar. When the Text Object pointer is active, this toolbar contains a color chart list. Use this list to select the color accent for the new text object. The color of your text object can be changed later using the Properties palette.

Create a text object by clicking anywhere on the EER Diagram canvas. This creates a new text object with the default name text1. To revert to the default mouse pointer, click the arrow icon at the top of the vertical toolbar.

Right-clicking a text object opens a pop-up menu. These menu options are identical to the options for other objects. However, since a text object is not a database object, there is no confirmation dialog box when you delete a text object.

## 9.1.9.2 The Text Object Editor

To invoke the text object editor, double-click a text object on the EER Diagram canvas. This opens the editor docked at the bottom of the application. Double-clicking the text object table undocks the editor. Double-click the title bar to redock it. Any number of text objects may be open at the same time. Each additional text objects appears as a tab at the top of the text editor.

Use the editor to change the name of a text object or its contents.

## Modifying a Text Object Using the Properties Palette

When you select a text object on the EER Diagram canvas, its properties are displayed in the Properties palette. Most of the properties accessible from the Properties palette apply to the appearance of a view on the EER Diagram canvas.

For a list of properties accessible through the Properties palette, see Section 9.1.1.12, "The Properties Palette".

There is no property in the Properties palette for changing the font used by a text object. To do so, choose the **Appearance** tab of the Workbench Preferences dialog. For more information, see Preferences: Modeling: Appearance.

# 9.1.10 Creating Images

Images exist only on the EER Diagram canvas; you can add them only from the EER Diagram window.

## 9.1.10.1 Adding Images to an EER Diagram

To add images to an EER Diagram, use the Image tool on the vertical toolbar. Make sure that the **EER Diagram** tab is selected, then right-click the image icon on the vertical toolbar. The image icon is the icon just above the table icon.

Clicking the mouse on this icon changes the mouse pointer to an image pointer. You can also change the mouse pointer to an image pointer by pressing the I key.

Create an image by clicking anywhere on the EER Diagram canvas. This opens a file open dialog box. Select the desired image, then close the dialog box to create an image on the canvas. To revert to the default mouse pointer, click the arrow icon at the top of the vertical toolbar.

Right-clicking this object opens a pop-up menu with the following items:

- Cut 'Image'
- Copy 'Image'
- Edit Image...
- Edit in New Window...
- Delete 'Image'

These menu items function in exactly the same way as they do for other objects on an EER diagram. However, images are not database objects so there is no confirmation dialog box when they are deleted.

## 9.1.10.2 The Image Editor

To invoke the image editor, double-click an image object on an EER Diagram canvas. This opens the image editor docked at the bottom of the application. Double-clicking the image editor tab undocks the editor. Double-click the title bar to redock it. Any number of images may be open at the same time. Each additional image appears as a tab at the top of the image editor.

#### The Image Tab

Use the **Image** tab of the image editor to perform the following tasks:

Rename the image using the Name text box.

• Browse for an image using the **Browse** button.

### Modifying a Image using the Properties Palette

When you select an image on the EER Diagram canvas, its properties are displayed in the **Properties** palette. Most of the properties accessible from the **Properties** palette apply to the appearance of an image on the EER Diagram canvas.

For a list of properties accessible through the **Properties** palette, see Section 9.1.1.12, "The Properties Palette".

# 9.2 Additional Modeling Tools

Additional modeling design tools and features.

# 9.2.1 Printing Diagrams

The printing options used to create printouts of your EER Diagrams are found under the **File** menu. To create *documentation* of your models, see The DBDoc Model Reporting Dialog Window (Commercial Editions).

## 9.2.1.1 Printing Options

The printing menu items not enabled unless an EER Diagram is active. These items are available:

· Page Setup...

Enables you to choose the paper size, orientation, and margins.

• Print

Sends your EER Diagram directly to the printer. This option generates a preview before printing. From the preview you can adjust the scale of the view and also choose a multi-page view. Clicking the printer icon at the top left of this window, prints the currently selected EER Diagram. Close the print preview window if you need to adjust the placement of objects on the EER Diagram canvas.

• Print to PDF...

Creates a PDF file of your EER Diagram.

• Print to PS...

Creates a PostScript file of your EER Diagram.

# 9.2.2 DBDoc Model Reporting

The DBDoc - Model Reporting dialog is found by opening a model, selecting **Model** from the menu, and then **DBDoc - Model Reporting**.

Note

This functionality is only available in the MySQL Workbench Commercial Editions.

Use the DBDoc-Model Reporting dialog to set the options for creating documentation of your database models. For example, the following figure shows the dialog with HTML Detailed Frames selected and the template style set to Vibrant.

X DBDoc - Model Reporting Generate a Report for the Current Model A detailed HTML report using frames. For printing HTML Basic Frames use a single page HTML report template. HTML Basic Single Page Text Basic Template Style: Vibrant Vibrant colors Basic Options Title: Model Report Title used for the report Output Path: %documentsfolder%/report\_%date% Browse... It is possible to use variables here. These values are supported: ·: The user's home directory (Linux/Mac only) %desktopfolder%: The user's desktop %documentsfolder%: The user's documents folder %date%: The current date %time%: The current time %vear%: The current year only %month%: The current month only (as number) %monthname%: The current month only (as text) %day%: The current day (as number) Content ▼ Output Table Columns Output Table Indices Output Foreign Keys Output References from Foreign Keys Include DDL code for objects Cancel Generate

Figure 9.14 The DBDoc Model Reporting Options

You can choose from four available templates to generate a report:

- HTML Basic Frames: Model documentation in HTML format that makes use of frames.
- HTML Basic Single Page: Single Page HTML documentation, not using frames.
- HTML Detailed Frames: Detailed HTML documentation, using frames.
- Text Basic: Text file documentation.

When you click a template, a preview image displays on the right side of the page. For the HTML Basic Frames template, you can select either the Colorful or the Restrained Colors option from the **Style** list. The HTML Basic Single Page template offers only the Colorful style. The HTML Detailed Frames template offers the Vibrant style, and also the more subdued Coated style. The Text Basic template offers only the Fixed Size Font style.

From the Base Options frame choose the report title and the output directory for the report files.

The following variables may be used to configure the output path:

- ~: The home directory of the user. Available on Linux and macOS versions only.
- %desktopfolder%: The desktop of the user.

• %documentsfolder%: The Documents folders of the user. The following table shows typical values for common platforms.

Platform	Typical Default Documents Folder
Windows	C:\Users\user_name\My Documents
Linux	~/Documents
macOS	Users/user_name/Documents

- %date%: The date in the format YYYY-MM-DD.
- %time%: The time in the format HHMM.
- %year%: The year in the format YYYY.
- %month%: The month in the format MM. January is 01 and December is 12.
- %monthname%: The name of the month, rather than the number.
- %day%: The day number in the format DD. For example, the 12th would be 12.

Content options can also be selected:

- Output Table Columns: Display all the columns.
- Output Table Indices: Display all the indexes.
- Output Foreign Keys: Display all the foreign keys.
- Output References from Foreign Keys: Display the tables that foreign keys reference.
- Include DDL code for objects: Generates DDL code.

Clicking the **Generate** button creates the directory defined in the **Output directory** text box. If you chose to create HTML Basic Frames, you will find the following files in this directory:

- basic.css: The style sheet for the overview.html page.
- index.html: The main page.
- overview.html: The model overview, the navigation links shown in the sidebar.
- restrained.css: The CSS file used if the Restrained Colors style option was chosen.
- table details.html: The main frame of the model report.

Choosing the HTML Basic Single Page option creates a style sheet and an index.html file.

Choosing the HTML Detailed Frames option creates the following files:

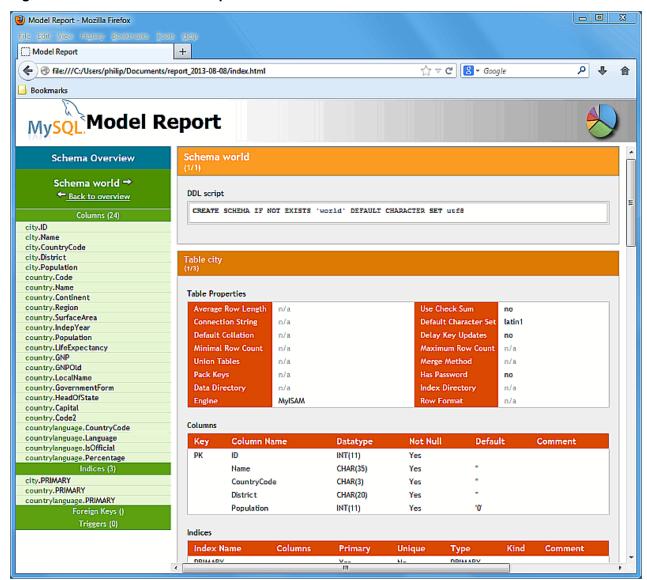

- basic.css: The style sheet for the overview.html page. This is used if the vibrant style is chosen.
- coated.css: The CSS file used if the Coated style option was chosen.
- index.html: The main page.
- overview.html: Overview information for the report such as report title, project name and author.
- overview\_list.html: A summary of schema in the model along with a list of tables contained in each schema.
- routine\_details.html: List of all routines for the schema.

- table\_details.html: The main report details.
- table\_details\_list.html: A Schema overview along with details of columns, indexes and foreign keys for each schema.
- table\_element\_details.html: The details for every element of the table.
- top.html: The top frame of the report.
- view\_details.html: List of all columns and indexes for the schema.

Choosing the Text Basic option creates a directory containing one text file.

You can click index.html to view a report. The following figure shows an output example of the HTML Detailed Frames report for the world schema.

Figure 9.15 The DBDoc Model Report

For more information about creating custom templates, see Section 9.7, "Customizing DBDoc Model Reporting Templates".

# 9.2.3 Schema Validation Plugins

MySQL Workbench provides validation modules so that you can test your models before implementing them.

#### Note

This functionality is only available in the MySQL Workbench Commercial Editions.

The validation plugins are accessed from the **Model** menu. One plugin performs general validation for any Relational Database Management System (RDMS) and the other is MySQL specific. Beneath these menu items are a number of specific validation tests. Running any one of these tests opens an output window docked at the bottom of the application. Warning messages are displayed on the left side of this window and the tests performed are displayed on the right.

The following sections outline the tasks performed by the validation modules.

#### 9.2.3.1 General Validation

The following list names the general validation types and gives examples of specific violations:

### Empty Content Validation

- · A table with no columns
- · A routine or view with no SQL code defined
- · A routine group containing no routines
- A table, view, or routine not referenced by at least one role
- · A user with no privileges
- Objects such as tables that do not appear on at least one EER Diagram

#### Table Efficiency Validation

- · A table with no primary key
- A primary key that does not use an integer-based data type
- A foreign key that refers to a column with a different data type

## · Duplicated Identifiers Validation

- · Duplicate object names
- Duplicate role or user names
- · Duplicate index or routine names

#### Consistency Validation

· Use of the same column with columns of differing data types

## Logic Validation

A foreign key that refers to a column other than the primary key in the source table

- · Any object that is object is either read only or write only by role definition
- Placeholder objects left over from reverse engineering

### 9.2.3.2 MySQL-Specific Validation

The following list names the MySQL-specific validation types and gives examples of specific violations:

#### Integrity Violation

- · An object name longer than the maximum permitted
- A foreign key defined for an engine type that does not support foreign keys (not yet implemented)
- A view or routine that references a nonexistent table (not yet implemented)
- A default value that does not match a column's data type
- · An invalid partitioning scheme

#### Syntax Violation

- A routine, trigger, or view with incorrect SQL syntax
- · A reserved keyword used as an identifier
- · Use of an invalid character

# 9.3 Modeling Tutorials

This chapter contains three short tutorials intended to familiarize you with the basics of MySQL Workbench. These tutorials show how MySQL Workbench can be used both to design and to document databases.

Creating a database from scratch is the focus of Section 9.3.4, "Using the Default Schema" and exploring the graphic design capabilities of MySQL Workbench is touched upon in Section 9.3.2, "Basic Modeling". Both these tutorials show the database design capabilities of MySQL Workbench.

Importing an SQL data definition script is probably the quickest way to familiarize yourself with MySQL Workbench—this tutorial makes use of the sakila database and emphasizes the use of MySQL Workbench as a documentation tool. Examples taken from the sakila database are used throughout the documentation, so this installation procedure is recommended.

# 9.3.1 Creating a Model

This tutorial describes how to create a new database model and how to forward-engineer a model to a live MySQL server.

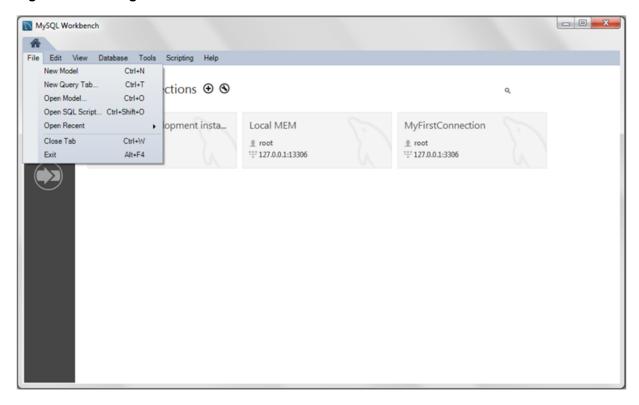

#### Note

Alternatively, you can create a model from a database by using the reverse engineering wizard. For additional information, see Section 9.4.2.2, "Reverse Engineering a Live Database".

Start MySQL Workbench. On the home screen, click the models icon in the sidebar and then click the + icon next to Models. Alternatively, you can click File and then New Model from the menu (shown in the figure that follows).

Figure 9.16 Getting Started Tutorial - Home Screen

A model can contain multiple schemata. Note that when you create a new model, it contains the mydb schema by default. You can change the name of this default schema as needed or you can delete it.

2. Click the + button on the right side of the **Physical Schemas** toolbar to add a new schema. The default schema name is <a href="new\_schema1">new\_schema1</a>, which you can now change to <a href="dvd\_collection">dvd\_collection</a> by modifying its Name field. Confirm this change in the **Physical Schemas** panel shown in the next figure. Now you are ready to add a table.

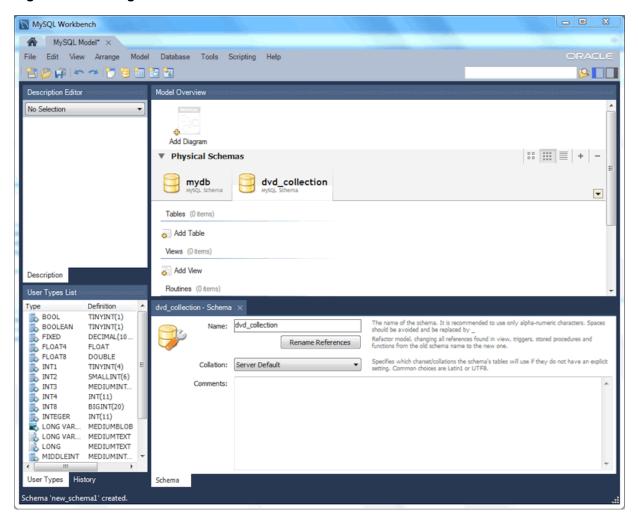

Figure 9.17 Getting Started Tutorial - New Schema

- 3. Double-click **Add Table** in the **Physical Schemas** section.
- 4. This automatically loads the table editor with the default table name table1. Edit the **Table Name** field to change the table name from table1 to movies.
- 5. Next, add columns to your table. Double-click a Column Name cell and the first field defaults to moviesid because (by default) MySQL Workbench appends id to the table name for the initial field. Change moviesid to movie\_id and keep the Datatype as INT, and also select the PK (PRIMARY KEY), NN (NOT NULL), and AI (AUTO\_INCREMENT) check boxes.
- 6. Add the two additional columns described in the following table. The figure that appears after the table shows all three columns in the movies table.

Column Name	Data Type	Column Properties
movie_title	VARCHAR(45)	NN
release_date	DATE (YYYY-MM-DD)	None

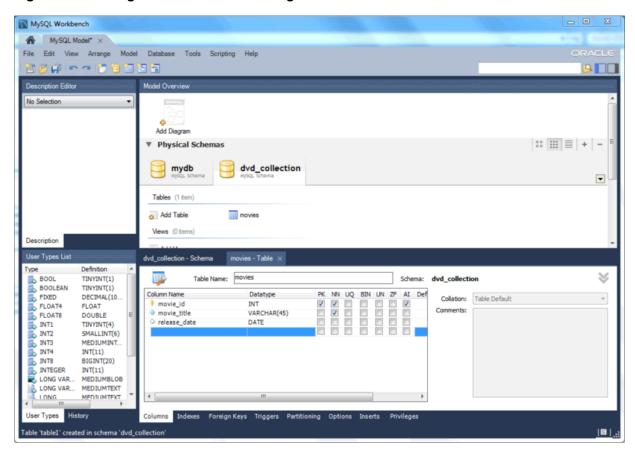

Figure 9.18 Getting Started Tutorial - Editing table columns

7. For a visual representation (EER diagram) of this schema, select **Model** and then **Create Diagram from Catalog Objects** to create the EER Diagram for the model. The next figure shows the a new tab titled **EER Diagram**, which displays diagram representation of the movies table and columns.

\_ D X MySQL Workbench MySQL Model\* (dvd\_collection.m...× EER Diagram × File Edit View Arrange Model Database Tools Scripting Help 🛅 🤌 🚅 🗢 🥕 🙍 🖹 Bird's Eye Diagram Modeling Additions Zoom: 100% - € Q B movies 0 movie\_id INT(11) title VARCHAR(45) orelease\_date DATE • • Catalog Tree ▼ 📴 dvd\_collection ⊞ ▼ 🛅 Tables ▶ III movies 4 🗃 Views **a** Routine Groups Catalog Layers User Types History Display 1:n Autoplace Objects of the Catalo. Figure 9.19 Getting Started Tutorial - EER Diagram

8. In the table editor, change the name of the column movie\_title to title. Note that the EER Diagram is automatically updated to reflect this change.

#### Note

To open the table editor, either change back to the **MySQL Model** tab and right-click on the movies table, or right-click on movies in the EER diagram and select an **Edit 'movies'** option.

9. Save the model by choosing **File** and then **Save Model** from the menu, or click the **Save Model to Current File** icon on the menu toolbar. For this tutorial, type **Home\_Media** and then click **Save**.

Before synchronizing your new model with the live MySQL server, confirm that you already created a MySQL connection. This tutorial assumes you have created a connection already. If not, see Section 5.2, "Creating A New MySQL Connection (Tutorial)" and use that tutorial to create a MySQL connection named MyFirstConnection, although an alternative connection can also work.

Now forward-engineer your model to the live MySQL server as follows:

- Select **Database** and then **Forward Engineer** from the menu to open the Forward Engineer to Database wizard.
- 2. The Connection Options step selects the MySQL connection and optionally sets additional options for the selected MySQL connection. Make any necessary connection changes and then click **Next**.

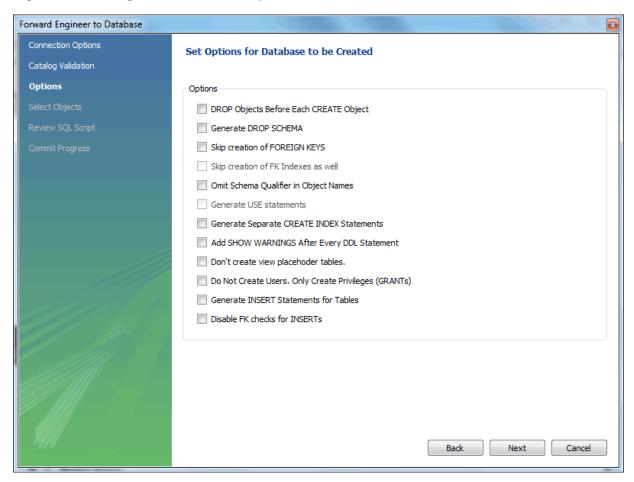

#### Note

You may decided to choose a different MySQL connection here, but this tutorial uses **MyFirstConnection**.

3. The Options step lists optional advanced options (as shown in the figure that follows). For this tutorial, you can ignore these options and click **Next**.

Figure 9.20 Getting Started Tutorial - Options

4. Select an object to export to the live MySQL server. In this case, there is only one table (dvd\_collection.movie). Select the Export MySQL Table Objects check box (as the figure that shows) and then click Next.

Forward Engineer to Database Connection Options Select Objects to Forward Engineer Catalog Validation To exclude objects of a specific type from the SQL Export, disable the corresponding checkbox. The Review SQL Script step displays the SQL script that will be executed on the live server to create your schema. Review the script to make sure that you understand the operations that will be carried out.

Click **Next** to execute the forward-engineering process.

6. The Commit Progress step confirms that each task was executed. Click **Show Logs** to view the logs. If no errors are present, click **Close** to close the wizard.

- 7. The new dvd\_collection database is now present on the MySQL server. Confirm this by opening the MySQL connection and viewing the schema list, or by executing SHOW DATABASES from the MySQL Command Line Client (mysql).
- 8. Click the Save Model to Current File icon on the menu toolbar to save the model.

For additional information about data modeling, see Chapter 9, Database Design and Modeling.

# 9.3.2 Basic Modeling

On the MySQL Model screen, double-click the **Add Diagram** icon (shown in the following figure). This action creates and opens a new EER Diagram canvas.

Figure 9.23 Adding an EER Diagram

From an EER diagram page you can graphically design a database.

### 9.3.2.1 Adding a Table

The tools in the vertical toolbar on the left of the **EER Diagram** tab are used for designing an EER diagram. Start by creating a table using the table tool. The table tool is the rectangular grid in the middle of the vertical toolbar. Mousing over it shows the message, Place a New Table (T).

Clicking this tool changes the mouse pointer to a hand with a rectangular grid. Create a table on the canvas by clicking anywhere on the EER Diagram grid.

Right-click the table and choose **Edit in New Window** from the pop-up menu. This opens the table editor, docked at the bottom of the application.

The table name defaults to table1. Change the name by entering invoice into the **Name:** field. Changes here affect the name of the tab in the table editor and the name of the table on the canvas.

Pressing **Tab** or **Enter** while the cursor is in the table name field selects the **Columns** tab of the table editor and creates a default column named <code>idinvoice</code>.

Pressing **Tab** or **Enter** again sets the focus on the <code>Datatype</code> list with <code>INT</code> selected. Notice that a field has been added to the table on the EER canvas.

Pressing **Tab** yet again and the focus shifts to adding a second column. Add a <code>Description</code> and a <code>Customer\_id</code> column. When you are finished, close the table editor, by clicking the **x** button on the top left of the table editor.

### 9.3.2.2 Creating a Foreign Key

Select the table tool again and place another table on the canvas. Name this table invoice\_item. Next click the 1:n Non-Identifying Relationship tool.

First, click the invoice\_item table; notice that a red border indicates that this table is selected. Next, click the invoice table. This creates a foreign key in the invoice\_item table, the table on the "many" side of the relationship. This relationship between the two tables is shown graphically in crow's foot notation.

Revert to the default mouse pointer by clicking the arrow at the top of the vertical toolbar. Click on the invoice\_item table and select the Foreign keys tab.

Click the **Foreign key Name** field. The referenced table should show in the **Referenced Table** column and the appropriate column in the **Referenced Column** column.

To delete the relationship between two tables, click the line joining the tables and then press **Control** +**Delete**.

Experiment with the other tools on the vertical toolbar. Delete a relationship by selecting the eraser tool and clicking the line joining two tables. Create a view, add a text object, or add a layer.

Save your changes to a MySQL Workbench Models file (mwb extension) by choosing **Save** from the **File** menu or by using the keyboard command **Control+S**.

## 9.3.3 Importing a Data Definition SQL Script

For this tutorial, use the sakila database script, which you can find by visiting the http://dev.mysql.com/doc/page, selecting the Other Docs tab, and looking in the Example Databases section

After downloading the file, extract it to a convenient location. Open MySQL Workbench and find the **Reverse Engineer MySQL Create Script** menu item by first choosing **File** and then **Import**. Find and import the <code>sakila-schema.sql</code> file. This is the script that contains the data definition statements for the <code>sakila</code> database. The file filter for the file open dialog window defaults to \*.sql so you should be able to view only files with the <code>sql</code> extension.

If the file was successfully imported, the application's status bar reads, Import MySQL Create Script done. To view the newly imported script, expand the **Physical Schemas** section by double-clicking the arrow on the left of the **Physical Schemas** title bar. Select the tab labeled **sakila**.

You may also wish to remove the default schema tab, mydb. Select this tab, then click - on the upper right in the **Physical Schemas** panel.

To view all the objects in the sakila schema, you may need to expand the **Physical Schemas** panel. Move the mouse pointer anywhere over the gray area that defines the lower edge of the **Physical Schemas** panel. Hold down the right mouse button and move the mouse to adjust the size of the window.

After you have expanded the window, all the objects in the sakila database should be visible. Tables appear at the top followed by views and then routines. There are no routine groups in this schema, but you should see the **Routine Groups** section and an Add Group icon.

For a complete description of importing a MySQL create script, see Section 9.4.2.1, "Reverse Engineering Using a Create Script".

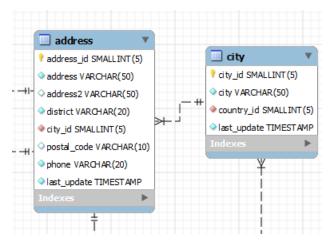

## 9.3.3.1 Adding an EER Diagram

To create an EER diagram for the sakila database, first add an EER diagram by double-clicking the Add Diagram icon in the **EER Diagrams** panel to create and open a new EER Diagram editor.

The EER Diagram canvas is where object modeling takes place. To add a table to the canvas, select the **Catalog** tab in the middle panel on the right side of the application to display any schemas that appear in the **MySQL Model** tab. Find the sakila schema and expand the view of its objects by clicking + to the left of the schema name. Expand the tables list in the same way.

You can add tables to the EER canvas by dragging them from the **Catalog** panel dropping them onto the canvas. Drop the address table and the city table onto the canvas, as the following figure shows.

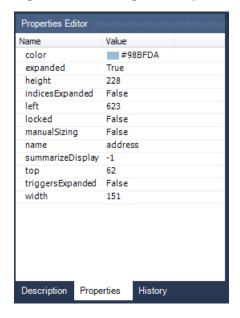

Figure 9.24 Adding Tables to the Canvas

MySQL Workbench automatically discovers that address.city\_id has been defined as a foreign key referencing the city.city\_id field. Drop the country table onto the canvas and immediately you should see the relationship between the country table and the city table. (To view all the relationships in the sakila database, see Figure 9.29, "The sakila Database EER Diagram".)

Click the **Properties** tab of the panel on the lower left and then click one of the tables on the canvas. This action displays the properties of the table in the <u>Properties</u> window, as the next figure shows. While a table is selected, you can use the <u>Properties</u> window to change a table's properties. For example, entering #FF0000 for the color value will change the color accent to red.

Figure 9.25 Viewing The Properties

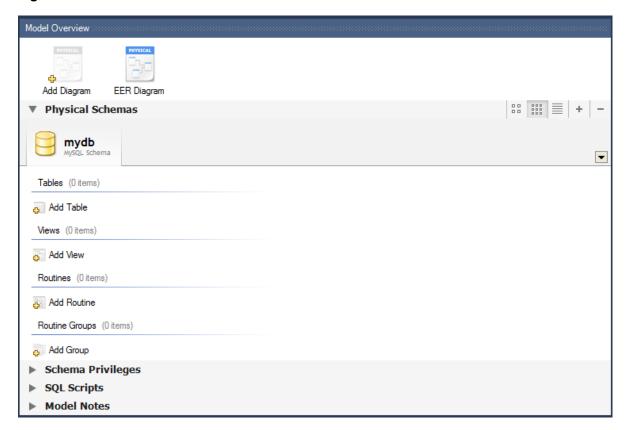

Changing the color of a table is a good way to identify a table quickly—something that becomes more important as the number of tables increases. Changing the color of a table is also an easy way to identify a table in the Model Navigator panel. This panel, the uppermost panel on the left side of the page, gives a bird's eye view of the entire EER canvas.

Save your changes to a MySQL Workbench Models file (mwb extension) by choosing **Save** from the **File** menu or by using the keyboard command **Control + S**.

# 9.3.4 Using the Default Schema

When you first open MySQL Workbench a default schema, mydb appears as the leftmost tab of the **Physical Schemas** section of MySQL Workbench as the following figure shows. You can begin designing a database by using this default schema.

Figure 9.26 The Default Schema

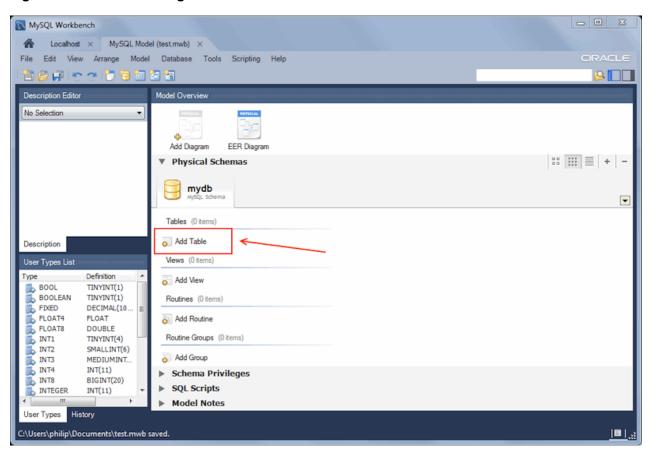

To change the name of the default schema, double-click the schema tab. This opens a schema editor window docked at the bottom of the application. To undock or redock this window, double-click anywhere in the editor title bar.

To rename the schema, use the field labeled **Name**. After you have renamed the schema, a lightning bolt icon appears right aligned in the **Name** field, indicating that other changes are pending. Click the **Comments** field and a dialog box opens asking if you wish to rename all schema occurrences. Clicking **Yes** ensures that your changes are propagated throughout the application. Add comments to the database and change the collation if you wish. Close the schema editor by clicking the **x** button.

### 9.3.4.1 Creating a New Table

Create a new table by double-clicking the **Add Table** icon in the **Physical Schemas** panel, as the next figure shows. This action opens the table editor docked at the bottom of the application. You can undock or dock this editor in exactly the same way as the schema editor window.

Figure 9.27 Model: Creating A New Table

Initially, the table name defaults to 'table1' in the table editor. The following figure describes the available actions.

Figure 9.28 Model: Editing Table Values

In the previous example, columns were added using the **Columns** tab. Clicking an empty row will add a new column, and clicking an existing column starts edit mode. Click the **Tab** key to move to the next column and set the column's data type.

Altering the table by adding indexes or other features is also possible using the table editor by clicking each tab within the table editor.

### 9.3.4.2 Creating Other Schema Objects

Additional objects such as views or routines can be added in the same way as tables.

Objects are listed under the **Catalog** palette on the right. To view these schema objects, select the **Catalog** tab in the middle palette on the right. View all the objects by clicking the **+** button to the left of the schema name.

Save your changes to a MySQL Workbench Models file (mwb extension) by choosing **Save** from the **File** menu or by using the keyboard command **Control+S**.

# 9.3.5 Documenting the sakila Database

This chapter demonstrates the capabilities of MySQL Workbench as a documentation tool by using the sakila database, which is a database sample provided by MySQL. You can find this database sample,

and others, by visiting the http://dev.mysql.com/doc/ page, selecting the **More** menu, and then locating the Example Databases section.

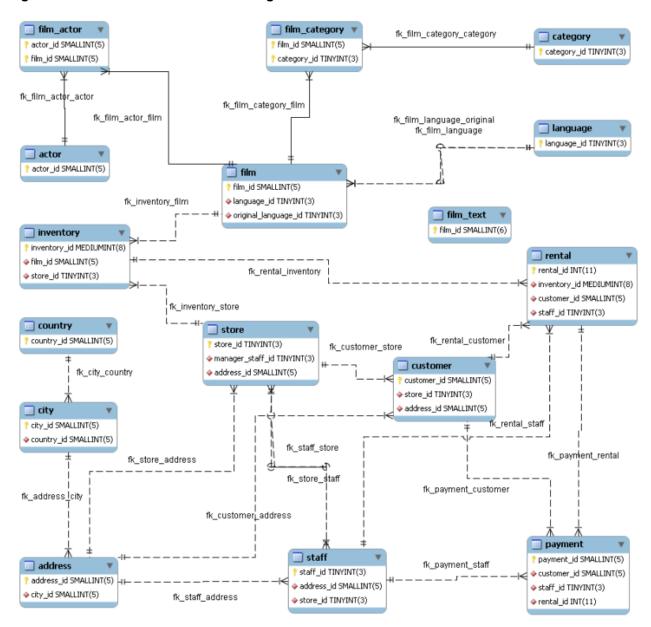

An EER diagram provides a quick overview and understanding of a database. Rather than reading through table definition statements, a quick glance at an EER diagram indicates how tables are related.

You can also see how tables are related; what the foreign keys are and what the nature of the relationship is

### A PNG File of the sakila Database

Find following an EER diagram showing the tables in the sakila database. The following figure shows the output that was created using the File, Export, Export as PNG menu item.

Figure 9.29 The sakila Database EER Diagram

The object notation style used in Figure 9.29, "The sakila Database EER Diagram" is Workbench (PKs only). This notation shows only primary keys and no other columns, which is especially useful where space is at a premium. The relationship notation is the default, Crow's Foot.

As the connection lines show, each table is related to at least one other table in the database (with the exception of the film\_text table). Some tables have two foreign keys that relate to the same table. For example the film table has two foreign keys that relate to the language table, namely fk\_film\_language\_original and fk\_film\_language. Where more than one relationship exists between two tables, the connection lines run concurrently.

Identifying and non-identifying relationships are indicated by solid and broken lines respectively. For example, the foreign key <code>category\_id</code> is part of the primary key in the <code>film\_category</code> table so its relationship to the <code>category</code> table is drawn with a solid line. On the other hand, in the <code>city</code> table, the foreign key, <code>country\_id</code>, is not part of the primary key so the connection uses a broken line.

# 9.4 Forward and Reverse Engineering

MySQL Workbench provides capabilities to forward engineering physical database designs. A visual data model can be transformed into a physical database on a target MySQL Server by executing the forward engineering wizard. All SQL code is automatically generated to help eliminate the normal error-prone process of manually writing complex SQL code. MySQL Workbench also enables you to reverse engineer an existing database or packaged application to get better insight into its database design. In addition to forward and reverse engineering existing databases, it can also import SQL scripts to build models, and export models to DDL scripts to execute at a later time.

## 9.4.1 Forward Engineering

It is possible to forward engineer a database using an SQL script or by connecting to a live database.

## 9.4.1.1 Forward Engineering Using an SQL Script

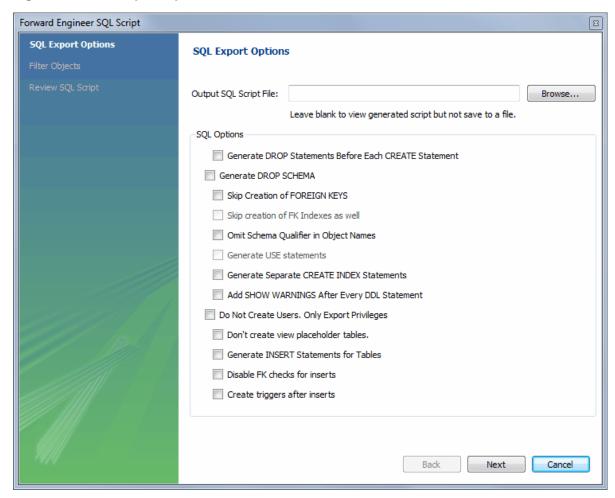

To create a script of your database model, choose the **Export** item from the **File** menu. You may export a script to alter an existing database or create a new database. The script to create a database is similar to the one created using the mysqldump <code>db\_name</code> command.

Choosing to create a database yields additional options.

#### Creating a Schema

Select the **File**, **Export**, **Forward Engineer SQL CREATE Script** menu item to start the Forward Engineer SQL Script wizard. The following figure shows the first page of the wizard.

Figure 9.30 SQL Export Options

The SQL Export Options displays the following facilities:

#### Output SQL Script File:

To specify the output file name, enter it into the **Output SQL Script File** field, or use the **Browse** button to select a file. Leave this field blank to view, but not save, the generated output.

#### Generate DROP Statements Before Each CREATE Statement

Select this option to generate a statement to drop each object before the statement that creates it. This ensures that any existing instance of each object is removed when the output is executed.

- Generate DROP SCHEMA
- Skip creation of FOREIGN KEYS
- · Skip creation of FK Indexes as well
- Omit Schema Qualifier in Object Names

Select this option to generate unqualified object names in SQL statements.

Generate USE statements

### Generate Separate CREATE INDEX Statements

Select this option to create separate statements for index creation instead of including index definitions in CREATE TABLE statements.

#### Add SHOW WARNINGS after every DDL statement

Select this option to add SHOW WARNINGS statements to the output. This causes display of any warnings generated when the output is executed, which can be useful for debugging.

#### Do Not Create Users. Only Export Privileges

Select this option to update the privileges of existing users, as opposed to creating new users. Exporting privileges for nonexistent users will result in errors when you execute the CREATE script. Exporting users that already exist will also result in an error.

#### · Don't create view placeholder tables

#### Generate INSERT Statements for Tables

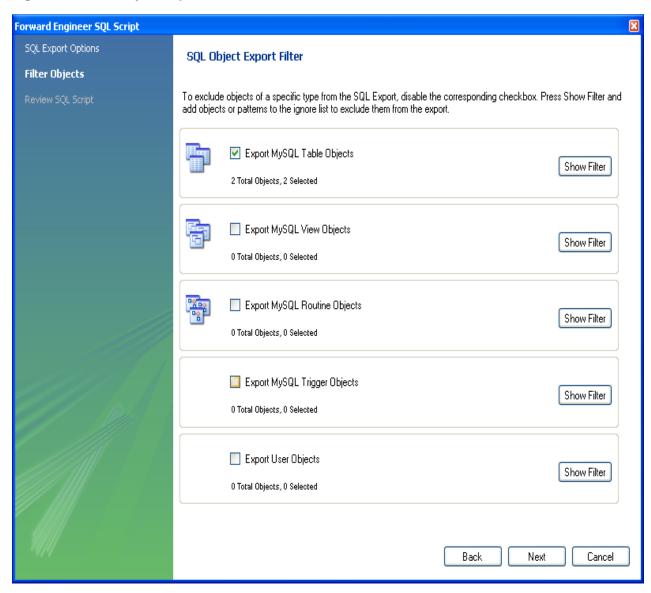

Select this option if you have added any rows to a table. For more information about inserting rows, see Section 8.1.1, "SQL Query Window".

#### · Disable FK checks for inserts

#### · Create triggers after inserts

Clicking **Next** opens the **SQL Object Export Filter** page (see the figure that follows), which enables you to select the objects for export.

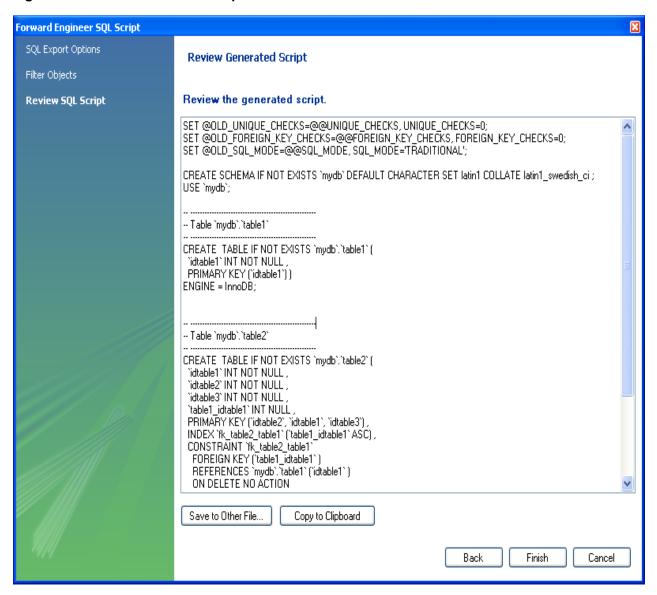

Figure 9.31 SQL Object Export Filter

Use **Show Filter** to fine tune (filter) the objects for export. After selecting the objects to export, click **Hide Filter** to hide the filter panel.

After selecting the objects to export, click **Next** to review the generated script. The following figure shows an example script to review.

Figure 9.32 Review Generated Script

You may return to the previous page using the **Back** button.

The **Finish** button saves the script file and exits. You can then use the saved script to create a database.

#### Altering a Schema

The menu item for creating an **ALTER Script File** is **Database**, **Synchronize With Any Source**. Typically, this option is used when the SQL script of a database has been imported into MySQL Workbench and changed, and then you want to create a script that can be executed against the database to alter it to reflect the adjusted model. For instructions on importing a DDL script, see Section 9.4.2.1, "Reverse Engineering Using a Create Script".

Select the **Database**, **Synchronize With Any Source** menu item to start the wizard. You will be presented with the first page showing the introduction and then the available options for setting the source and destinations of the updates.

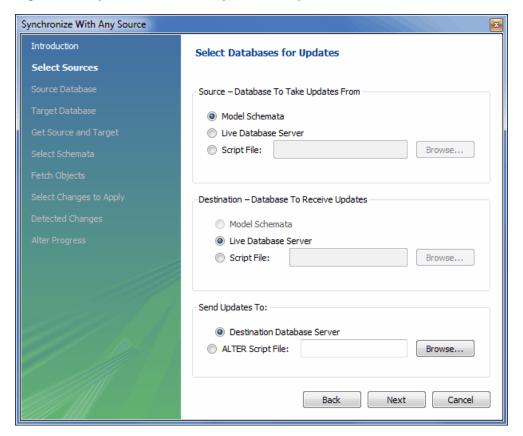

Figure 9.33 Synchronize With Any Source: Options

For additional information, see Section 9.5.1, "Database Synchronization".

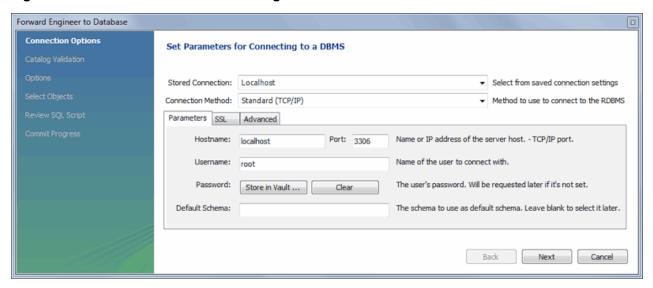

## 9.4.1.2 Forward Engineering to a Live Server

Use forward engineering to export your schema design to a MySQL server.

Select the model that you wish to forward engineer and then choose the **Database**, **Forward Engineer** menu item from the main menu.

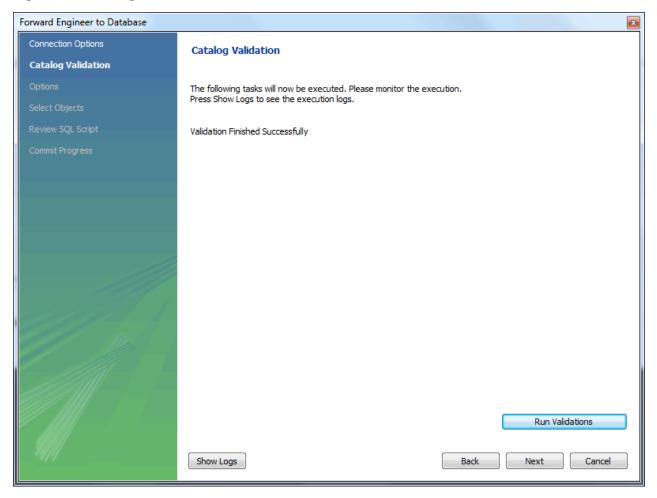

The first step of the process is to connect to a MySQL server to create the new database schema. As the following figure shows, this page enables you to use a previously stored connection or to enter the connection parameters.

Figure 9.34 Set Parameters for Connecting to a DBMS

Click **Next** after setting the connection parameters. The next page of the wizard displays Catalog Validation, as the following figure shows. Validation is available only in the Commercial Edition.

Figure 9.35 Catalog Validation

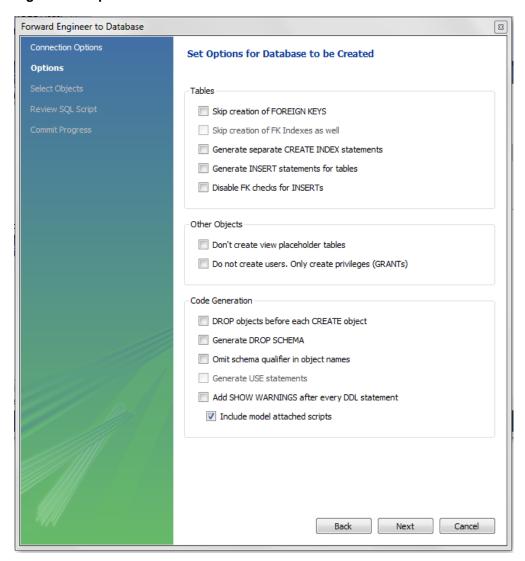

Click Run Validations to validate the catalog.

Click **Next** to continue.

The next page enables you to set options for the database to be created (see the following figure). These options are as described in Creating a Schema.

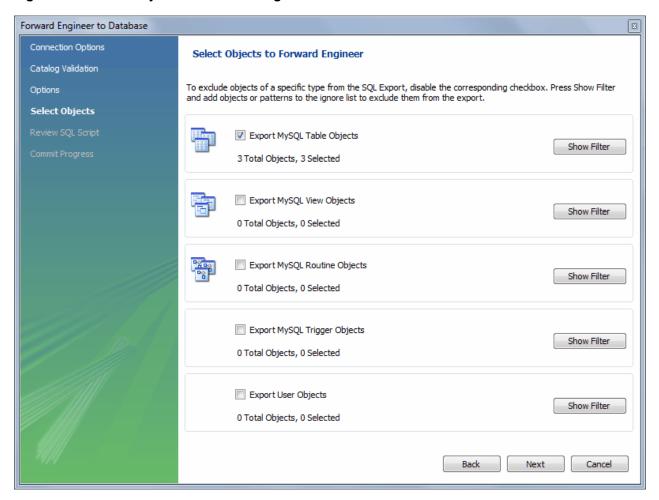

Figure 9.36 Options

Select the required options and then click Next.

As the following figure shows, the Select Objects page enables you to select the objects to forward engineer: Table objects, view objects, routine objects, trigger objects, and user objects.

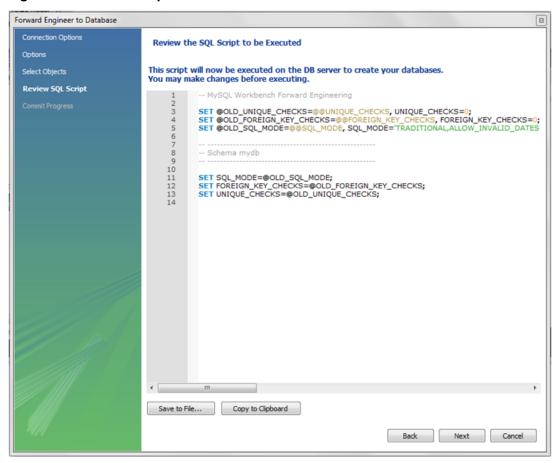

Figure 9.37 Select Objects to Forward Engineer

To select a subset of objects to forward engineer, use the **Show Filter/Hide Filter** button, then select specific objects. After you have selected your objects, click **Next** to continue

On the Review Script page you may review and edit the SQL script that will be executed.

Figure 9.38 Review Script

Click **Next** to continue if you are satisfied with the generated script.

The next page of the wizard displays the results of the forward engineering process.

Figure 9.39 Forward Engineering Progress

You can confirm that the script created the schema by connecting to the target MySQL server and issuing a SHOW DATABASES statement.

# 9.4.2 Reverse Engineering

With MySQL Workbench, you can reverse-engineer a database using a MySQL create script or you can connect to a live MySQL server and import a single database or a number of databases.

## 9.4.2.1 Reverse Engineering Using a Create Script

To reverse-engineer a database using a create script, click **File**, **Import**, and then **Reverse Engineer MySQL Create Script** from the menu with a model selected and its model tab open.

Tables, views, routines, routine groups, indexes, keys, and constraints can be imported from an SQL script file. Objects imported using an SQL script can be manipulated within MySQL Workbench the same as other objects. The following figure shows an example of the input and options available for this action.

Place imported objects on a diagram

Figure 9.40 Reverse Engineer SQL Script: Input

- Select SQL script file: Open a file with the default file type set to an SQL script file, a file with the extension sql.
- File encoding: Defaults to UTF8.
- Place imported objects on a diagram: Also create an EER diagram in MySQL Workbench.

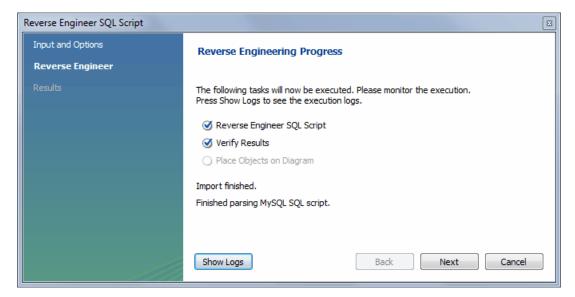

#### Note

Importing a large number (1000) objects could fail to create an EER diagram and instead emit a resource warning with the text "Too many objects are selected for auto placement. Select fewer elements to create the EER diagram." In this case, execute the reverse engineering wizard with this option disabled, manually create the EER diagram, and then import the 1000+ objects using the EER diagram catalog viewer.

If your script creates a database, MySQL Workbench creates a new **Physical Schemas** area within the open **MySQL Model** tab.

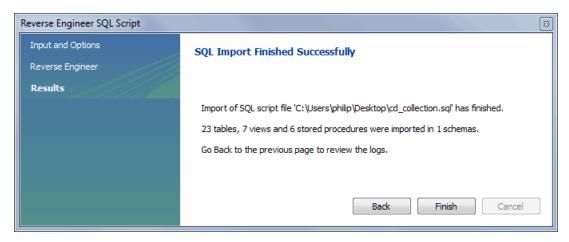

Click **Execute** to reverse-engineer the SQL script, verify its results, and optionally place the objects in a new EER diagram. The next figure shows an example of the finished operation.

Figure 9.41 Reverse Engineer SQL Script: Execution

Click **Next** to view a summary of the results and then **Finish** to close the wizard.

Figure 9.42 Reverse Engineer SQL Script: Results

Before exiting MySQL Workbench, save the schema. Click **File** and then **Save** from the menu to save the reverse-engineered database as a MySQL Workbench file with the extension mwb.

For a tutorial on reverse engineering the sakila database, see Section 9.3.3, "Importing a Data Definition SQL Script".

### Creating a DDL script

You can create a data definition (DDL) script by executing the mysqldump db\_name --no-data > script\_file.sql command. Using the --no-data option ensures that the script contains only DDL statements. However, if you are working with a script that also contains DML statements you need not remove them; they will be ignored.

#### Note

If you plan to redesign a database within MySQL Workbench and then export the changes, be sure to retain a copy of the original DDL script. You will need the original script to create an ALTER script. For more information, see Altering a Schema.

Use the --databases option with mysqldump if you wish to create the database as well as all its objects. If there is no CREATE DATABASE db\_name statement in your script file, you must import the database objects into an existing schema or, if there is no schema, a new unnamed schema is created.

### 9.4.2.2 Reverse Engineering a Live Database

To reverse-engineer a live database, click **Database** and then **Reverse Engineer** from the menu. The figure that follows shows an example of the Reverse Engineer Database wizard.

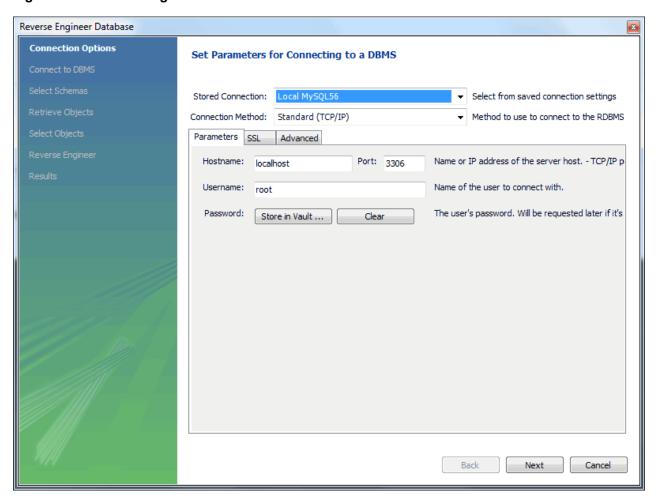

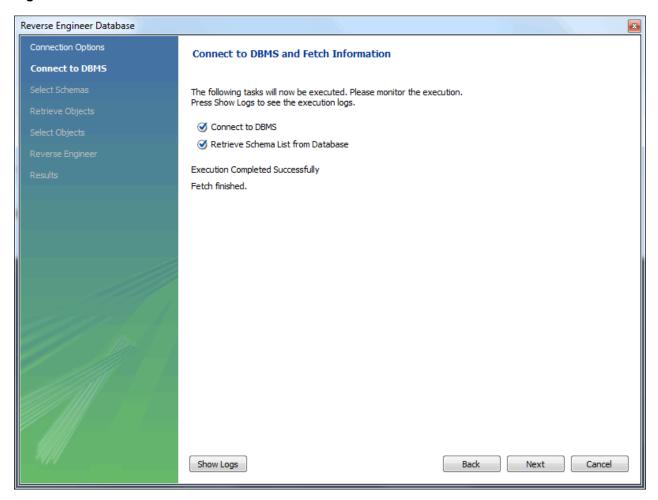

Figure 9.43 Reverse Engineer Database Wizard

The first step of the wizard enables you to set up a connection to the live database you intend to reverseengineer. You can set up a new connection or select a previously created stored connection. Typical information required for the connection includes host name, user name and password.

After this information has been entered, or you have selected a stored connection, click the **Next** button to proceed to the next step (shown in the figure that follows).

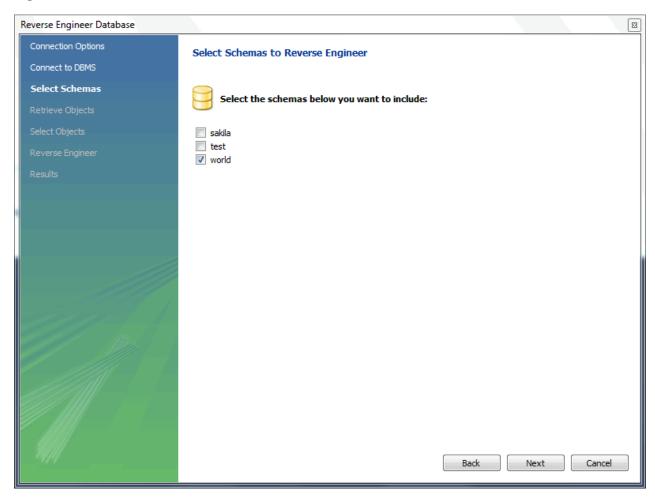

Figure 9.44 Connect to DBMS

Review the displayed information to make sure that the connection did not generate errors, then click Next.

The next step displays the schemas available on the server. Select the check box of each schemas you intend to process. In the following figure, the world schema is selected.

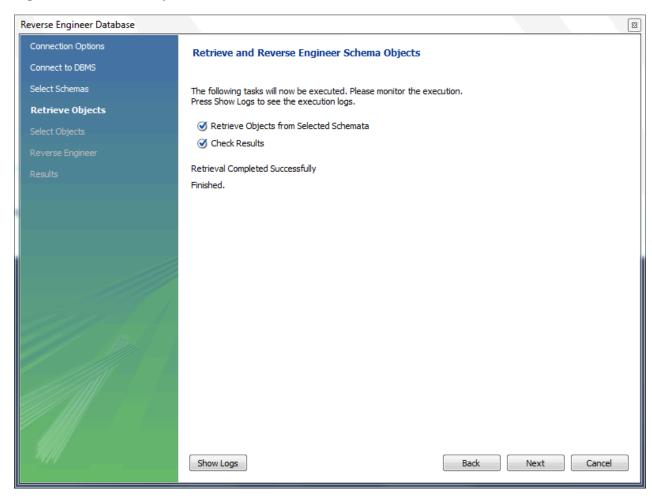

Figure 9.45 Select Schemas

After you have selected the desired schemas, click the **Next** button to continue.

The wizard then displays the tasks it carried out and summarizes the results of the operation.

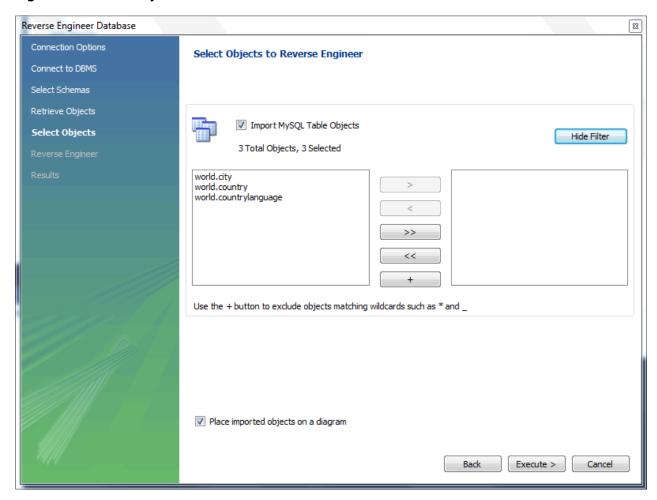

Figure 9.46 Retrieve Objects

Review the results before clicking **Next** to continue.

The next step opens the Select Objects page. It has a section for each object type present in the schema (tables, views, routines, and so forth). This step is of special interest if you do not intend to import all the objects from the existing database. It gives you the option of filtering which objects are imported. Each section has a **Show Filter** button. Click this button if you do not want to import all the objects of a specific type. The following figure shows an example with the filter open.

Figure 9.47 Select Objects

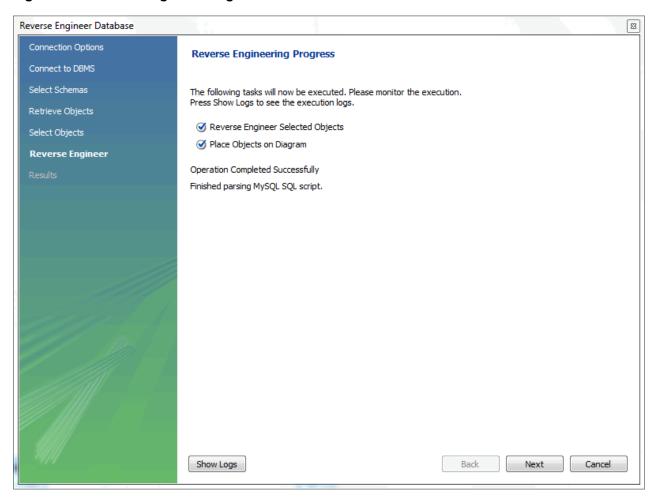

The options enable you to select specific tables for import. Having selected the desired tables, you can hide the filter by clicking **Hide Filter**.

The other sections, such as MySQL Routine Objects, have similar filters available.

Click **Execute** to continue to the next step.

The wizard then imports objects, displaying the tasks that have been carried out and whether the operation was successful. If errors were generated, you can click **Show Logs** to see the nature of the errors. The next figure shows an example of the operational progress, which completed successfully.

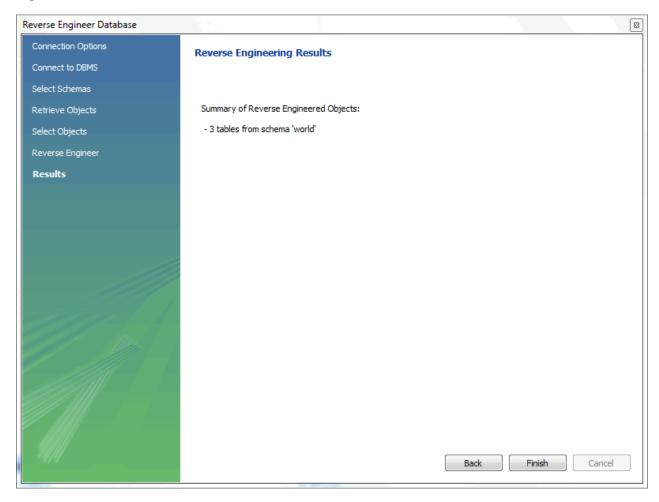

Figure 9.48 Reverse Engineer Progress

Click **Next** to continue to the next step.

The final step of the wizard provides a summary of the reverse-engineered objects, as the following figure shows.

Figure 9.49 Results

Click Finish to close the wizard.

Before closing MySQL Workbench, save the schema. Click **File** and then **Save** from the menu to save the reverse-engineered database as a MySQL Workbench file with the extension mwb.

#### **Errors During Reverse Engineering**

During reverse engineering, the application checks for tables and views that duplicate existing names and disallows duplicate names if necessary. If you attempt to import an object that duplicates the name of an existing object you will be notified with an error message. To see any errors that have occurred during reverse engineering, click **Show Logs**. This action will create a panel containing a list of messages, including any error messages than may have been generated. Click **Hide Logs** to close the panel.

If you plan to import an object with the same name as an existing object, rename the existing object before reverse engineering.

If you import objects from more than one schema, there will be a tab in the Physical Schemas area of the MySQL Model page for each schema imported.

You cannot reverse-engineer a live database that has the same name as an existing schema. To reuse a schema name, you must first rename the existing schema.

# 9.5 Schema Synchronization and Comparison

Database change management is a complex process that involves maintaining different versions of database schemas and manually modifying existing databases. To help with this administration task, MySQL Workbench includes schema synchronization and comparison utilities. You can compare two live databases, two models, or models with live databases, to visually see the differences and optionally perform a synchronization routine.

# 9.5.1 Database Synchronization

Synchronize data between models, databases, and SQL files. These three types can be the target (destination), source, or both. You can also select/deselect individual objects and modify their direction during the synchronization. For example, synchronize tables from a model to your database, other tables from your database to your model, and skip a few tables, all during the same synchronization process.

#### Note

Be aware that backward incompatible MySQL syntax changes are introduced over time, so for this reason it is important to set the **Default Target MySQL Version** modeling preference according to your needs. For example, exporting results from a MySQL 5.7 target might yield invalid syntax when executed against MySQL 5.1. See also Section 3.2.4, "Modeling Preferences".

To start, select **Synchronize With Any Source** from the **Database** navigation menu, as the following figure shows. Alternatively, select **Synchronize Model** to open the same wizard that defaults to a model. A Model or EER diagram must be selected for these synchronization options to be present under the **Database** navigation menu.

#### Caution

Because MySQL databases correspond to directories within the data directory, you must consider case sensitivity for database, table, and trigger names, which follow the case sensitivity rules of the underlying file system for your operating system. Synchronizing models with objects that differ in case may lead to MySQL Workbench producing a DROP statement for that object, before recreating it as lowercase. For more information, see Identifier Case Sensitivity

Workarounds include using a consistent convention, where the most portable code uses lower case database and table names. Or a temporary workaround is to delete the DROP SCHEMA IF EXISTS line from the generated query.

MySQL Workbench enables control over objects to synchronize, and the direction of synchronization for each object. Synchronization options include:

- Specify all or specific tables and objects to synchronize.
- Synchronize both the model and live database, or only update one or the other (unidirectional or bidirectional).
- · Optionally update from or to an SQL script file.

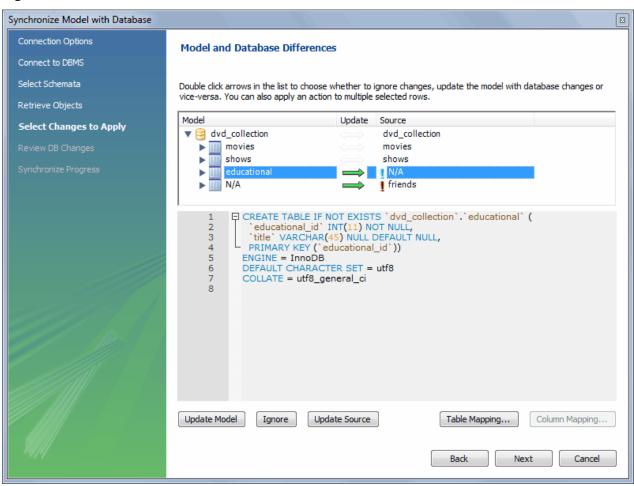

- Instead of executing the synchronization, you may generate an ALTER Script File to later perform the appropriate updates.
- Fine-tune how the synchronization will be performed by choosing the direction of each individual object or by configuring particular objects to be ignored.

There are two similar database synchronization wizards available from the **Database** menu. The simpler **Synchronize Model** wizard, and the more flexible **Synchronize with Any Source** wizard. The descriptions below apply to both, unless explicitly told otherwise.

### Synchronize Model (with Database)

To start the wizard, open a model and select **Database**, **Synchronize Model** from the main menu. Follow the sequence of steps until you reach the **Select Changes to Apply** step, as the next figure shows.

Figure 9.51 Model and Database Differences

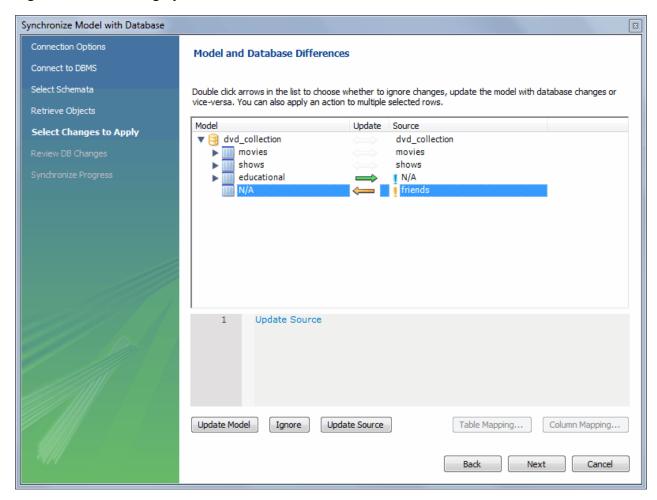

In the preceding example, the live database and model both have movies shows tables. In the MySQL Workbench, an additional table, educational, has been created in the model, but it lacks an equivalent in the live database. Further, friends exists in the live database, but it is not in the model. By default, the actions will synchronize the database with the model, so in this example the educational table will be added to the source, and the friends table will be removed from the source.

As described in the GUI, double-clicking the arrows will alternate between the **Update Model**, **Ignore**, and **Update Source** actions. You may also select a row and click one of the three action buttons. Also note that clicking on a row will reveal the associated SQL statement, as shown in the previous figure.

The next figure shows an example of how the direction of synchronization can be changed.

Figure 9.52 Controlling Synchronization Direction

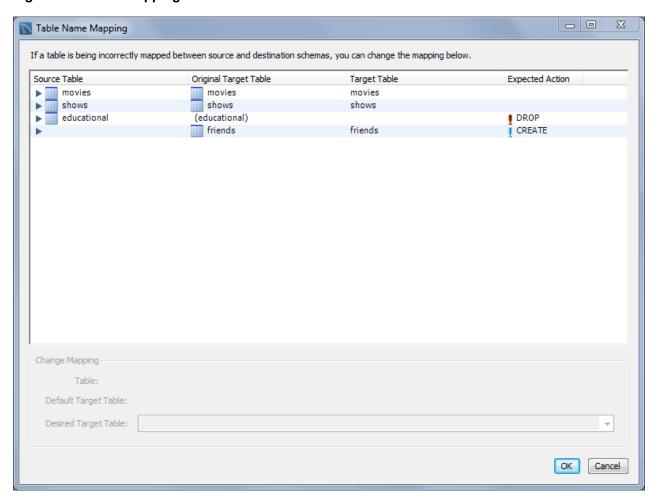

In this case, the synchronization direction has been changed so that rather than the default action of friends being dropped from the live database, it will be incorporated into the MySQL Workbench model. As before, educational table will be added to the live (source) database.

The three actions available actions are:

- **Update Model**: Causes the selected changes to be applied to the model, from the live database.
- **Ignore**: Causes the changes to be ignored. No synchronization will take place for those changes. This is designated with a double arrow that is crossed out.
- Update Source: Causes the changes to be applied only to the live database.

Clicking **Table Mapping** offers additional mapping options, as the following figure shows.

Figure 9.53 Table Mapping

Clicking **Next** reveals the SQL statement to perform the configured model and live database (source) synchronization. The following figure shows an example preview.

Synchronize Model with Database Connection Options Preview Database Changes to be Applied Connect to DBMS SET @OLD\_UNIQUE\_CHECKS=@@UNIQUE\_CHECKS, UNIQUE\_CHECKS=0; Select Schemata SET @OLD\_FOREIGN\_KEY\_CHECKS=@@FOREIGN\_KEY\_CHECKS, FOREIGN\_KEY\_CHI 2 SET @OLD\_SQL\_MODE=@@SQL\_MODE, SQL\_MODE='TRADITIONAL,ALLOW\_INVALIC 4 ☐ CREATE TABLE IF NOT EXISTS `dvd\_collection`.`educational` (

Figure 9.54 Previewing The Synchronization SQL Statement

You may now save the SQL statement to a file or the clipboard, or execute the SQL statement. If you choose to execute the change in MySQL Workbench, then you may optionally choose to skip "DB changes" so that only your model is altered.

### **Synchronize With Any Source**

To start the wizard, open a model and select **Database** and then **Synchronize With Any Source** from the main menu. The steps are similar to the **Synchronize Model** wizard, but with additional options to create SQL script files, use SQL script files, or both. The following figure shows the **Select Sources** settings.

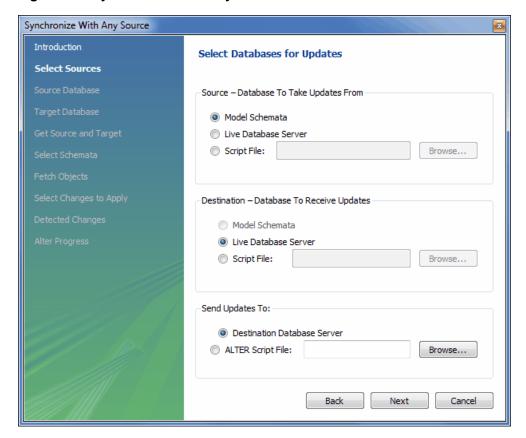

Figure 9.55 Synchronize With Any Source: Select Sources

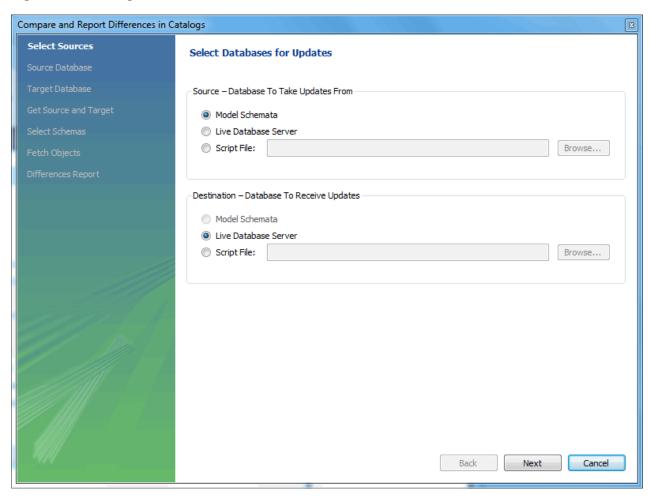

Notice how the source and destination types can be altered. The steps that follow depend on these source and destination types, and the **Synchronize Model** describes the basic functionality of this wizard.

## 9.5.2 Compare and Report Differences in Catalogs

This facility enables you to create a report detailing the differences between your MySQL Workbench model, and a live database or script. Choose **Database**, **Compare Schemas** from the main menu to run the **Compare and Report Differences in Catalogs** wizard.

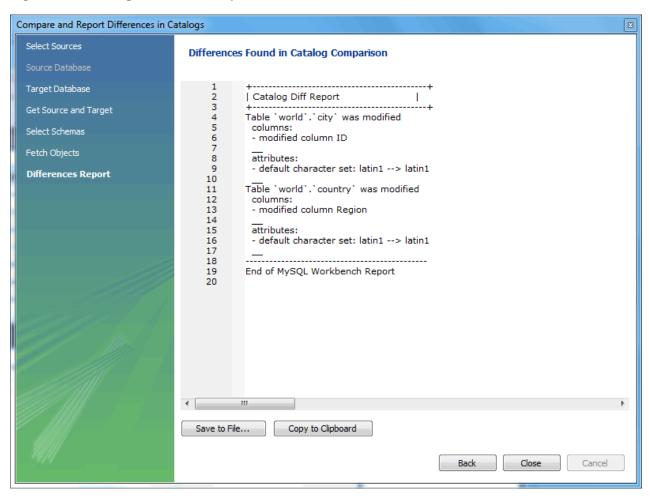

As the following figure shows, the first step in the wizard enables you to specify which catalogs to compare. For example, you may choose to compare your live database against your current MySQL Workbench model.

Figure 9.56 Catalog Sources Selection

You then proceed through the wizard, providing connection information if accessing a live database. The wizard then produces a catalog diff report showing the differences between the compared catalogs, as the next figure shows.

Figure 9.57 Catalog Differences Report

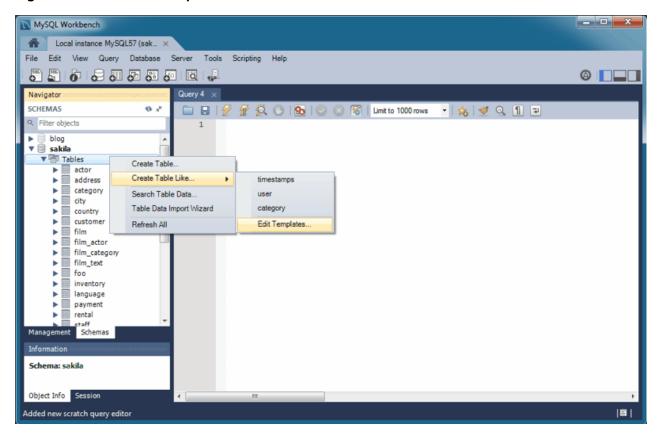

## 9.6 Table Templates

Define table templates with commonly used columns and settings to create new tables from either a live connection or while creating an EER model.

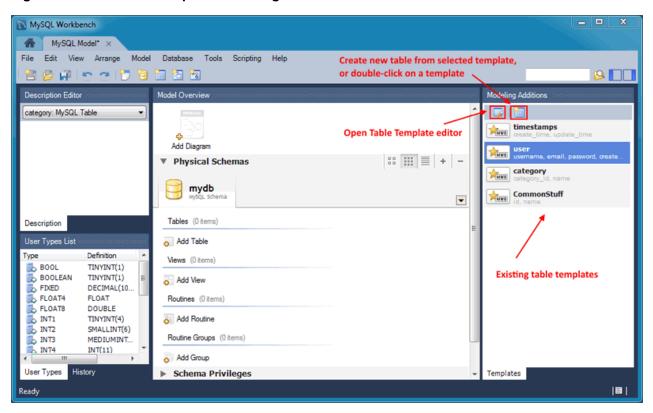

From the SQL editor, select Create Table Like from the Tables context menu, as shown in the next figure.

Figure 9.58 New Table Template: SQL Editor

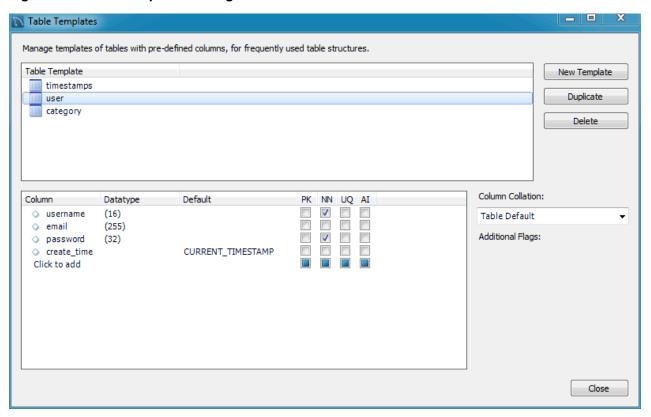

Or while modeling, click the "Open the table template editor" icon under **Modeling Additions**, as the following figure shows.

Figure 9.59 New Table Template: Modeling

After opening the **Table Templates** manager, make the adjustments and then click **Apply** to commit the changes. The following figure shows an example of column, data type, and default values that you can adjust for the user template.

Figure 9.60 Table Templates Manager

To open an existing template from the SQL editor, hover over the **Create Table Like** context menu and select the desired table template. For modeling, double-click on a template in the right modeling sidebar.

## 9.7 Customizing DBDoc Model Reporting Templates

This section provides an overview of creating and modifying DBDoc Model Reporting templates, as used by MySQL Workbench.

The MySQL Workbench DBDoc Model Reporting system is based on the Google Template System. This discussion does not attempt to explain the Google Template System in detail. For a useful overview of how the Google Template System works, see the Google document, How To Use the Google Template System.

The templates employed by the DBDoc Model Reporting system are text files that contain *Markers*. These text files are processed by the template system built into MySQL Workbench, and the markers replaced by actual data. The output files are then generated. It is these output files, typically HTML or text, that are then viewed by the user.

Markers can be of six types:

- Template Include
- Comment
- · Set delimiter
- Pragma

- Variable
- Section start and Section end

The last two are the most commonly used in MySQL Workbench templates and these important markers are briefly described in the following sections.

#### Variables

Variable usage in the templates is straightforward. Variables denoted by markers in the template file are replaced by their corresponding data prior to the generated output file. The mapping between variables and their corresponding data is stored by MySQL Workbench in a *data dictionary*. In the data dictionary, the variable name is the *key* and the variable's corresponding data is the *value*. MySQL Workbench builds the data dictionaries and fills it with the data contained in the processed model.

By way of example, the following code snippet shows part of a template file:

```
Total number of Schemata: {{SCHEMA_COUNT}}
```

In the generated output file, the variable  $\{\{SCHEMA\_COUNT\}\}$  is replaced by the number of schemata in the model:

```
Total number of Schemata: 2
```

A variable can appear multiple times in the template file.

#### Sections

Sections are used to perform iteration in the templates. When MySQL Workbench exchanges the variables in a section for data, it does so iteratively, using all data in the data dictionary in which the variable is defined. MySQL Workbench builds the data dictionaries according to the model currently being processed.

Consider the following code snippet:

```
{{#SCHEMATA}}
Schema: {{SCHEMA_NAME}}
{{/SCHEMATA}}
```

In the preceding snippet, the section start and end are indicated by the { #SCHEMATA} and { { / SCHEMATA} } markers. When MySQL Workbench processes the template, it notes the section and iterates it until the variable data for { {SCHEMA\_NAME} } in the corresponding data dictionary is exhausted. For example, if the model being processed contains two schemata, the output for the section might resemble the following:

```
Schema: Airlines
Schema: Airports
```

#### **Data Dictionaries**

It is important to understand the relationship between sections and data dictionaries in more detail. In a data dictionary the *key* for a variable is the variable name, a marker. The variable *value* is the variable's data. The entry for a section in a data dictionary is different. For a section entry in a data dictionary, the key is the section name, the marker. However, the value associated with the key is a list of data dictionaries. In MySQL Workbench each section is usually associated with a data dictionary. You can think of a section as *activating* its associated dictionary (or dictionaries).

When a template is processed, data dictionaries are loaded in a hierarchical pattern, forming a tree of data dictionaries. This is illustrated by the following table.

Table 9.1 Data Dictionaries Tree

Data Dictionary	Loads Data Dictionary
MAIN	SCHEMATA
SCHEMATA	TABLES, COLUMNS (Detailed is true), FOREIGN_KEYS (Detailed is true), INDICES (Detailed is true)
TABLES	REL_LISTING, INDICES_LISTING, COLUMNS_LISTING, TABLE_COMMENT_LISTING, DDL_LISTING
COLUMNS_LISTING	COLUMNS (Detailed is false)
REL_LISTING	REL (Detailed is false)
INDICES_LISTING	INDICES (Detailed is false)

The root of the tree is the *main* dictionary. Additional dictionaries are loaded from the root to form the dictionary tree.

#### Note

If a template has no sections, any variables used in the template are looked up in the main dictionary. If a variable is not found in the main dictionary (which can be thought of as associated with the default, or main, section), no data is generated in the output file for that marker.

#### **Evaluation of variables**

The tree structure of the data dictionaries is important with respect to variable evaluation. As variables are defined in data dictionaries, their associated values have meaning only when that particular data dictionary is active, and that means when the section associated with that data dictionary is active. When a variable lookup occurs, the system checks the data dictionary associated with the current section. If the variable value can be found there, the replacement is made. However, if the variable's value is not found in the current data dictionary, the parent data dictionary is checked for the variable's value, and so on up the tree until the main data dictionary, or root, is reached.

Suppose that we want to display the names of all columns in a model. Consider the following template as an attempt to achieve this:

```
Report
-----
Column Name: {{COLUMN_NAME}}
```

This template produces no output, even for a model that contains one or more columns. In this example, the only data dictionary active is the main dictionary. However, <code>COLUMN\_NAME</code> is stored in the <code>COLUMNS</code> data dictionary, which is associated with the <code>COLUMNS</code> section.

With this knowledge, the template can be improved as follows:

```
Report
-----
{{#COLUMNS}}
Column Name: {{COLUMN_NAME}}
{{/COLUMNS}}
```

This still does not produce output. To see why, see Table 9.1, "Data Dictionaries Tree". The COLUMNS data dictionary has the parent dictionary COLUMNS\_LISTING. COLUMNS\_LISTING has the parent TABLES, which has the parent SCHEMATA, whose parent is the main dictionary. Remember that for a dictionary to be involved in variable lookup, its associated section must currently be active.

To achieve the desired output, the template must be something like the following:

```
Report
-----

{{#SCHEMATA}}

{{#TABLES}}

{#COLUMNS_LISTING}}

{#COLUMNS}

Column Name: {{COLUMN_NAME}}

{{/COLUMNS}}

{/COLUMNS_LISTING}}

{{/COLUMNS_LISTING}}

{{/COLUMNS_LISTING}}

{{/COLUMNS_LISTING}}

{{/COLUMNS_LISTING}}

{{/COLUMNS_LISTING}}
```

The following template is the same, but with explanatory comments added:

```
Report
-----

{{! Main dictionary active}}

{{#SCHEMATA}} {{! SCHEMATA dictionary active}}

{{#TABLES}} {{! TABLES dictionary active}}

{{#COLUMNS_LISTING}} {{! COLUMNS_LISTING dictionary active}}

{{#COLUMNS}} {{! COLUMNS dictionary active}}

Column Name: {{COLUMN_NAME}} {{! COLUMN_NAME variable is looked-up, and found, in COLUMNS data dictionary}}

{{/COLUMNS}}

{{/COLUMNS_LISTING}}

{{/COLUMNS_LISTING}}

{{/TABLES}}

{{/SCHEMATA}}
```

Imagine now that for each column name displayed you also wanted to display its corresponding schema name, the template would look like this:

```
Report
-----

{{#SCHEMATA}}

{{#TABLES}}

{{#COLUMNS_LISTING}}

{#COLUMNS}}

Schema Name: {{SCHEMA_NAME}} Column Name: {{COLUMN_NAME}}

{{/COLUMNS}}

{{/COLUMNS_LISTING}}

{{/TABLES}}

{{/SCHEMATA}}
```

When variable lookup is performed for SCHEMA\_NAME, the COLUMNS dictionary is checked. As the variable is not found there the parent dictionary will be checked, COLUMNS\_LISTING, and so on, until the variable is eventually found where it is held, in the SCHEMATA dictionary.

If there are multiple schemata in the model, the outer section is iterated over a matching number of times, and SCHEMA\_NAME accordingly has the correct value on each iteration.

It's important to always consider which dictionary must be active (and which parents) for a variable to be evaluated correctly. The following section has a table that helps you identify section requirements.

## 9.7.1 Supported Template Markers

The following table shows the supported markers. These markers can be used in any template, including custom templates.

#### Using the table

The table shows which variables are defined in which sections. The variable should be used in its correct section or its value will not be displayed. If a variable type is a variable, then the table describes its data dictionary, and a parent dictionary if type is a section. Also remember that the data dictionaries used to perform variable lookups form a hierarchical tree, so it is possible to use a variable in a child section that is defined in a parent section.

**Table 9.2 Supported Template Markers** 

Marker text	Туре	Data Dictionary or Parent Dictionary	Corresponding data
TITLE	Variable	MAIN	Title of the report
GENERATED	Variable	MAIN	Date and time when the report was generated
STYLE_NAME	Variable	MAIN	The name of the style selected in MySQL Workbench, this is typically used to load the corresponding CSS file, depending on the name of the style selected in MySQL Workbench
SCHEMA_COUNT	Variable	MAIN	The number of schemata in the model
PROJECT_TITLE	Variable	MAIN	Project title as set for the model in <b>Document Properties</b>
PROJECT_NAME	Variable	MAIN	Project name as set for the model in <b>Document Properties</b>
PROJECT_AUTHOR	Variable	MAIN	Project author as set for the model in <b>Document Properties</b>

DDL_SCRIPT	Variable	DDL_LISTING	Display the DDL script of the currently active entity; for example, SCHEMATA, TABLES

## 9.7.2 Creating a Custom Template

In the simplest case, a template consists of two files: a template file, which has a .tpl extension, and a special file info.xml. The info.xml file has important metadata about the template. A third file is optional, which is the preview image file. This preview file provides a thumbnail image illustrating the appearance of the generated report.

One of the easiest ways to create a custom template is to make a copy of any existing template.

For example, the following procedure describes how to make a custom template based on the Text Basic template.

- 1. Navigate to the folder where the templates are stored. Assuming that MySQL Workbench has been installed into the default location on Windows, this would be C:\Program Files\MySQL\MySQL Workbench 5.0 SE\modules\data\wb\_model\_reporting.
- 2. Copy the Text\_Basic.tpl folder. The copy can be given any suitable name; for example, Custom\_Basic.tpl.
- 3. Edit the info.xml file to reflect your custom template. The unedited file in this case is shown here:

```
<?xml version="1.0"?>
  <value type="object" struct-name="workbench.model.reporting.TemplateInfo"</pre>
 id="{BD6879ED-814C-4CA3-A869-9864F83B88DF}" struct-checksum="0xb46b524d">
   <value type="string" key="description">
     A basic TEXT report listing schemata and objects.
    </value>
    <value type="string" key="name">HTML Basic Frame Report
   <value type="list" content-type="object"</pre>
   content-struct-name="workbench.model.reporting.TemplateStyleInfo"
    key="styles">
      <value type="object" struct-name="workbench.model.reporting.TemplateStyleInfo"</pre>
     id="{7550655C-CD4B-4EB1-8FAB-AAEE49B2261E}" struct-checksum="0xab08451b">
        <value type="string" key="description">
         Designed to be viewed with a fixed sized font.
        </value>
        <value type="string" key="name">Fixed Size Font</value>
        <value type="string" key="previewImageFileName">
         preview_basic.png
        </value>
        <value type="string" key="styleTagValue">fixed</value>
      </value>
    </value>
    <value type="string" key="mainFileName">report.txt</value>
  </value>
</data>
```

The file defines wwo objects: the TemplateInfo object and the TemplateStyleInfo object. These objects contain information about the template that will be displayed in the DBDoc Model Reporting wizard main page.

Change the object GUIDs that are used in the file. In this example, there are two that need replacing:

```
id="{BD6879ED-814C-4CA3-A869-9864F83B88DF}"
...
id="{7550655C-CD4B-4EB1-8FAB-AAEE49B2261E}"
```

Generate two new GUIDS. This is done using a suitable command-line tool, and there are also free online tools that generate GUIDs. MySQL's UUID() function also generates GUIDs:

Once you have the new GUID values, edit the info.xml file accordingly.

- 5. Edit the textual information for the TemplateInfo and TemplateStyleInfo objects to reflect the purpose of the custom template.
- 6. The modified file will now look something like the following:

```
<?xml version="1.0"?>
  <value type="object" struct-name="workbench.model.reporting.TemplateInfo"</pre>
 id="{cac9ba3f-ee2a-49f0-b5f6-32580fab1640}" struct-checksum="0xb46b524d">
    <value type="string"</pre>
    key="description">
     Custom basic TEXT report listing schemata and objects.
    </value>
    <value type="string" key="name">Custom Basic text report</value>
    <value type="list" content-type="object"</pre>
    content-struct-name="workbench.model.reporting.TemplateStyleInfo" key="styles">
      <value type="object"</pre>
      struct-name="workbench.model.reporting.TemplateStyleInfo"
     id="{39e3b767-a832-4016-8753-b4cb93aa2dd6}" struct-checksum="0xab08451b">
        <value type="string" key="description">
          Designed to be viewed with a fixed sized font.
        </value>
        <value type="string" key="name">Fixed Size Font</value>
       <value type="string" key="previewImageFileName">preview_basic.png</value>
       <value type="string" key="styleTagValue">fixed</value>
    </value>
    <value type="string" key="mainFileName">custom_report.txt</value>
  </value>
</data>
```

7. Create the new template file. This too may best be achieved, depending on your requirements, by editing an existing template. In this example the template file report.txt.tpl is shown here:

```
MySQL Workbench Report
Total number of Schemata: {{SCHEMA_COUNT}}
_____
{{#SCHEMATA}}
{{SCHEMA_NR}}. Schema: {{SCHEMA_NAME}}
## Tables ({{TABLE_COUNT}}) ##
{\{\text{#TABLES}\}}{\{\text{TABLE\_NR\_FMT}\}}. Table: {\{\text{TABLE\_NAME}\}}
{{#COLUMNS_LISTING}}## Columns ##
Key Column Name Datatype Not Null Default Comment
\label{eq:column_nothull} $$ { \{ COLUMN_DEFAULTVALUE \} \} $$ $$ { \{ COLUMN_COMMENT \} \} $$} $$
{{/COLUMNS}}}{{/COLUMNS_LISTING}}
{{#INDICES_LISTING}}## Indices ##
Index Name Columns Primary Unique Type Kind Comment
{{#INDICES}}{{INDEX_NAME}}{{#INDICES_COLUMNS}}{{INDEX_COLUMN_NAME}} »
{{INDEX_COLUMN_ORDER}}}{{INDEX_COLUMN_COMMENT}}}{{/INDICES_COLUMNS}} »
{{INDEX_PRIMARY}}{{INDEX_UNIQUE}}{{INDEX_TYPE}}{{INDEX_KIND}}{{INDEX_COMMENT}}
{{/INDICES}}{{/INDICES_LISTING}}
{{#REL_LISTING}}## Relationships ##
Relationship Name Relationship Type Parent Table Child Table Cardinality
\label{eq:conditional} $$ {{\tt REL\_NAME}} {{\tt REL\_TYPE}} {{\tt REL\_PARENTTABLE}} {{\tt REL\_CHILDTABLE}} {{\tt REL\_CARD}} $$
{{/REL}}}{{/REL_LISTING}}
```

This template shows details for all schemata in the model.

8. The preceding template file can be edited in any way you like, with new markers being added, and existing markers being removed as required. For the custom template example, you might want to create a much simpler template, such as the one following:

This simplified report just lists the schemata and the tables in a model. The date and time the report was generated is also displayed as a result of the use of the {{GENERATED}} variable.

9. The custom template can then be tested. Start MySQL Workbench, load the model to generate the report for, select the Model, DBDOC - Model Reporting menu item. Then select the new custom template from the list of available templates, select an output directory, and click Finish to generate the report. Finally, navigate to the output directory to view the finished report.

MySQL Workbench provides the ability to migrate ODBC-compliant databases to MySQL.

- Convert (migrate) different database types, including MySQL, across servers
- · Convert tables and copy data, but will not convert stored procedures, views, or triggers
- · Allows customization and editing during the migration process
- · Works on Linux, macOS, and Microsoft Windows

This is not an exhaustive list. The following sections discuss these and additional migration capabilities.

Setup may be the most challenging aspect of using the MySQL Workbench Migration Wizard. There is the installation section, which describes setting up ODBC requirements for Linux, macOS, and Microsoft

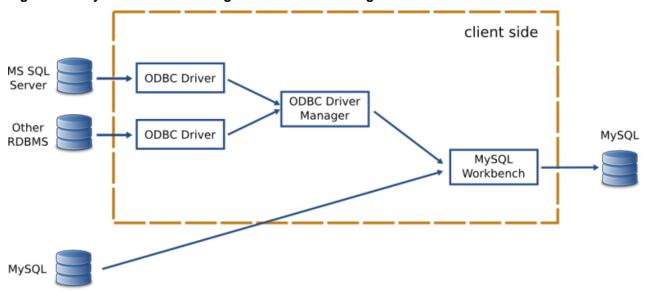

Windows, and the Database Product Specific Notes section that references setup conditions for each RDBMS.

## 10.1 General Installation Requirements

The MySQL Workbench Migration Wizard uses ODBC to connect to a source database, except for MySQL. You will need the ODBC driver installed that corresponds to the database you want to migrate from. For example, PostgreSQL can be migrated with the psqlodbc ODBC driver; Microsoft SQL Server can be migrated using the native Microsoft SQL Server driver on Windows or with FreeTDS on Linux and macOS.

The following figure shows the general components involved in an ODBC connection.

Figure 10.1 MySQL Workbench migration installation diagram

When specifying the source RDBMS, you can either use a data source configured externally, or provide the individual connection parameters to MySQL Workbench. If you already have an ODBC Data Source configured in your system, then you can use that in MySQL Workbench.

#### Note

The migration process does not support source or target RDBMS connections through SSH.

A workaround is to set up an encrypted tunnel, and then treat the MySQL target as a standard TCP (unencrypted) connection.

### 10.1.1 ODBC Libraries

#### Note

This section may be skipped when using a MySQL Workbench binary that is provided by Oracle.

An ODBC Driver Manager library must be present. Both Windows and macOS provide one.

#### Linux

iodbc: MySQL Workbench binaries provided by Oracle already include iODBC and no additional action is required. If you compile it yourself, you must install iODBC or unixODBC. iODBC is recommended. You

can use the iODBC library provided by your distribution by installing the libiodbc2 package on Debian based systems, or libiodbc on RPM based systems.

pyodbc: is the Python module used by MySQL Workbench to interface with ODBC, and may be used to migrate ODBC compliant databases such as PostgreSQL and DB2. In Windows and macOS, it is included with Workbench. In Linux, binaries provided by Oracle also include pyodbc.

If you're using a self-compiled binary, make sure you have the latest version, and that it is compiled against the ODBC manager library that you chose, whether it is iODBC or unixODBC. As of version 3.0.6, pyodbc will compile against unixODBC by default. If you are compiling against iODBC then you must perform the following steps:

- 1. For compiling, make sure you have the iODBC headers installed. For Linux, the name depends on your system's package manager but common names are libiodbc-devel (RPM based systems) or libiodbc2-dev (Debian based systems). For macOS, the headers come with the system and no additional action is required for this step.
- 2. In the pyodbc source directory, edit the setup.py file and around line 157, replace the following line: settings['libraries'].append('odbc') with settings['libraries'].append('iodbc')
- 3. Execute the following command as the root user: CFLAGS=`iodbc-config --cflags` LDFLAGS=`iodbc-config --libs` python setup.py install

### 10.1.2 ODBC Drivers

For each RDBMS, you need its corresponding ODBC driver, which must also be installed on the same machine that MySQL Workbench is running on. This driver is usually provided by the RDBMS manufacturer, but in some cases they can also be provided by third party vendors or open source projects.

Operating systems usually provide a graphical interface to help set up ODBC drivers and data sources. Use that to install the driver (i.e., make the ODBC Manager "see" a newly installed ODBC driver). You can also use it to create a data source for a specific database instance, to be connected using a previously configured driver. Typically you need to provide a name for the data source (the DSN), in addition to the database server IP, port, username, and sometimes the database the user has access to.

If MySQL Workbench is able to locate an ODBC manager GUI for your system, the **Open ODBC Administrator** button on the migration wizard's overview page will open it.

- Linux: There are a few GUI utilities, some of which are included with unixODBC. Refer to the documentation for your distribution. iODBC provides iodbcadm-gtk.
- macOS: You can use the ODBC Administrator tool that is separate download from Apple, or an ODBC Management tool from a different vendor. If the tool is installed in the /Applications/Utilities folder, you can start it using the **Open ODBC Administrator** button.
- Microsoft Windows: You can use the Data Sources (ODBC) tool under Administrative Tools. If present, the Open ODBC Administrator button will start it.

#### **ODBC** Driver architecture

Since the ODBC driver needs to be installed in the client side, you will need an ODBC driver that supports your clients operating system and architecture. For example, if you are running MySQL Workbench from Linux x64, then you need a Linux x64 ODBC driver for your RDBMS. In macOS, MySQL Workbench is built as a 32-bit application, so you need the 32-bit drivers.

## 10.2 Migration Overview

The Migration Wizard performs the following steps when migrating a database to MySQL:

- 1. Connects to the source RDBMS and retrieves a list of available databases/schemas.
- 2. Reverse engineers selected database/schemas into a internal representation specific to the source RDBMS. This step will also perform the renaming of objects/schemas depending on the type of object name mapping method that is chosen.
- 3. Automatically migrates the source RDBMS objects into MySQL specific objects.
  - a. Target schema objects are created.
  - b. Target table objects are created.
    - i. Columns for each table are copied.
      - A. Data types are mapped to MySQL data types.
      - B. Default values are mapped to a MySQL supported default value, if possible.
    - ii. Indexes are converted.
    - iii. Primary Keys are converted.
    - iv. Triggers are copied, and commented out if the source is not MySQL.
  - c. Foreign Keys for all tables (of all schemas) are converted.
  - d. View objects are copied, and commented out if the source is not MySQL.
  - e. Stored Procedure and Function objects are copied, and commented out if the source is not MySQL.
- 4. Provides an opportunity to review the changes, for editing and correcting errors in the migrated objects.
- 5. Creates the migrated objects in the target MySQL server. If there are errors, you can return to the previous step and correct them, and retry the target creation.
- 6. Copy data of the migrated tables from the source RDBMS to MySQL.

MySQL Workbench provides support for migrating from some specific RDBMS products. The Migration Wizard will provide the best results when migrating from such products. However, in some cases, other unsupported database products can also be migrated by using its Generic database support, as long as you have an ODBC driver for it. In this case, the migration will be less automatic, but should still work nonetheless.

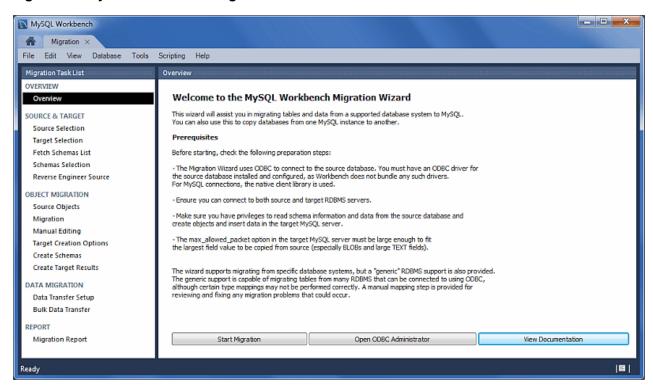

## 10.2.1 A Visual Guide to Performing a Database Migration

This example migrates a Microsoft SQL Server database to MySQL and includes an image for each step.

From MySQL Workbench, choose **Database** and then **Migrate** to open the migration wizard and display the migration wizard overview (see the figure that follows).

#### Overview

Figure 10.2 MySQL Workbench migration: Overview

It describes the prerequisites and requirements that should be understood before proceeding further. The **Open ODBC Administrator** option will load odbcad32.exe, and is used to confirm that the ODBC Driver for SQL Server is installed, and to make configuration changes if needed.

Click Start Migration to continue.

#### **Source Selection**

Select the source RDBMS that is migrating to MySQL. Choose the **Database System** that is being migrated and the other connection parameters will change accordingly. The following figure shows an example of the connection session.

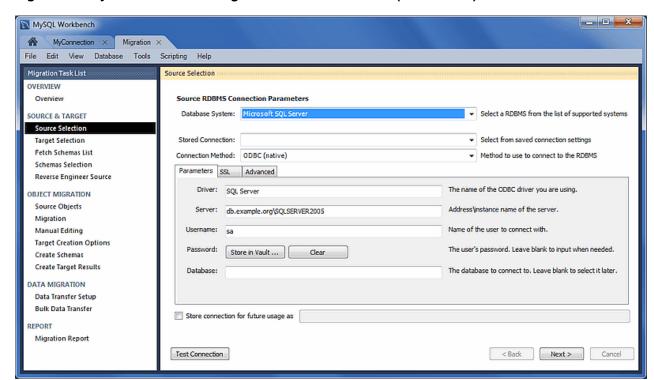

Figure 10.3 MySQL Workbench migration: Source Selection (Parameters)

### **Target Selection**

The target is the MySQL database that will contain the newly migrated database (see the figure that follows). The current Workbench MySQL connections will be available here, or you can choose **Manage DB Connections** to create a new connection.

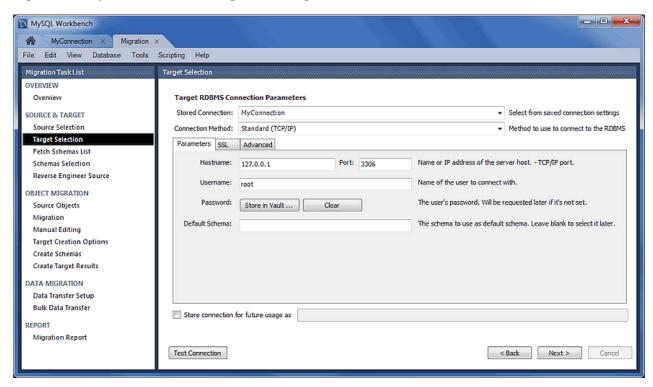

Figure 10.4 MySQL Workbench migration: Target selection

#### **Fetch Schemas List**

The Schemas list is retrieved from both the source and target RDBMS (see the figure that follows). This is an automated and informational step that reports connection related errors and/or general log information. Click **Next** to continue.

### **Schemas Selection**

Choose the schemas you want to migrate.

"Schema Name Mapping Method" options while migrating Microsoft SQL Server:

- Keep schemas as they are: Catalog.Schema.Table -> Schema.Table: This will create multiple databases, one per schema.
- Only one schema: Catalog.Schema.Table -> Catalog.Table: Merges each schema into a single database. The following figure shows an example of this mapping method.
- Only one schema, keep current schema names as a prefix: Catalog.Schema.Table ->
  Catalog.Schema\_table: Preserves the schema name as a prefix.

### **Reverse Engineer Source**

The source metadata is fetched from the source RDBMS and then is reverse-engineered. This is an automated and informational step that reports related errors, general log information, or both (see the figure that follows). View the logs and then click **Next** to continue.

## **Migration**

The migration process now converts the selected objects into MySQL compatible objects (see the figure that follows). View the logs and then proceed.

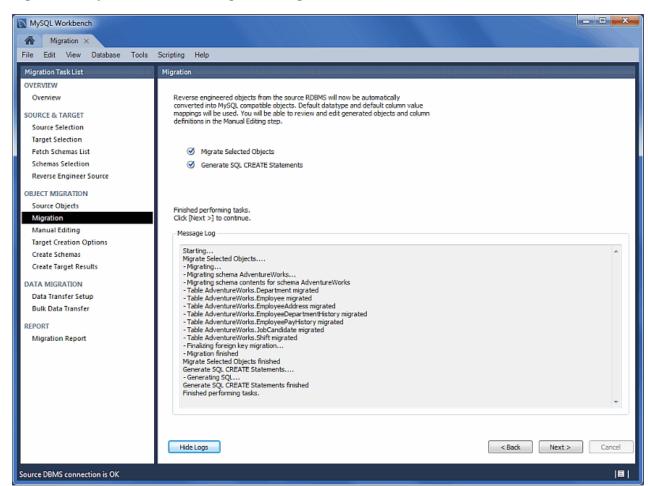

Figure 10.9 MySQL Workbench migration: Migration

#### **Manual Editing**

There are three sections to edit, which are selected by using the **View** select box on the top right. The **Show Code and Messages** button is available with every view and it will show the generated MySQL code that corresponds to the selected object.

• **Migration Problems**: This will either report problems or display "No mapping problems found." It is an informational screen. The following figure shows an example of this type of message.

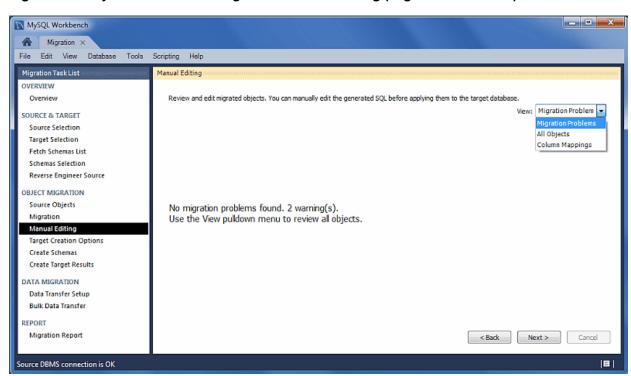

Figure 10.10 MySQL Workbench migration: Manual Editing (Migration Problems)

• **All Objects**: An object view that allows you to view and edit the object definitions. Double-click on a row to modify a target objects name. The following figure shows an example of this type of message.

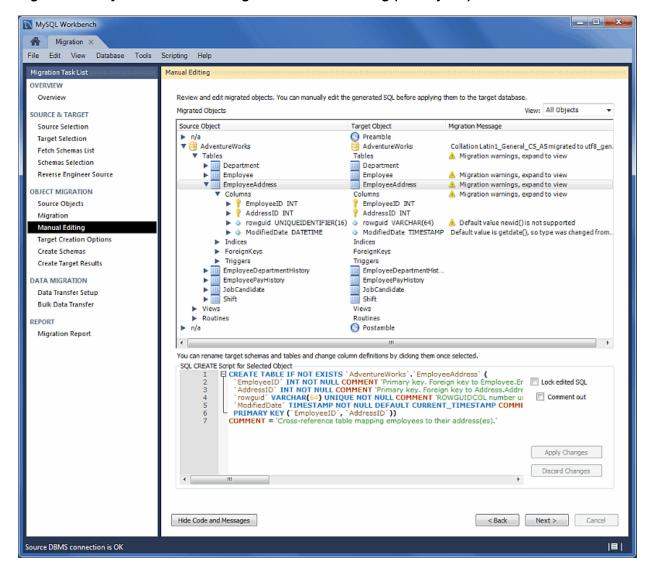

Figure 10.11 MySQL Workbench migration: Manual Editing (All Objects)

• **Column Mappings**: Shows all of the table column mappings, and allows you to individually review and fix the mapping for all column types, default values, and other attributes. The following figure shows an example of this type of message.

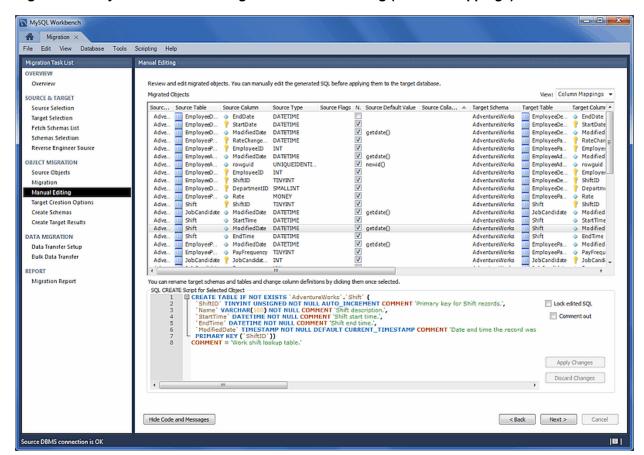

Figure 10.12 MySQL Workbench migration: Manual Editing (Column Mappings)

## **Target Creation Options**

The schema may be created by either adding it to the target RDBMS, creating an SQL script file, or both. The following figure shows the target creation options.

## **Create Target Results**

The generated objects in this example are listed in the figure that follows, along with the error messages if any exist.

The migration code may also be viewed and edited here. To make changes, select an object, edit the query code and then click **Apply**. Repeat this process for each object that will be edited. Finally, click **Recreate Objects** to save the results.

#### Note

The **Recreate Objects** operation is required to save any changes here. It will then execute the previous migration step (**Create Schema**) with the modified code, and then continue the migration process. This also means that the previously saved schema will be dropped.

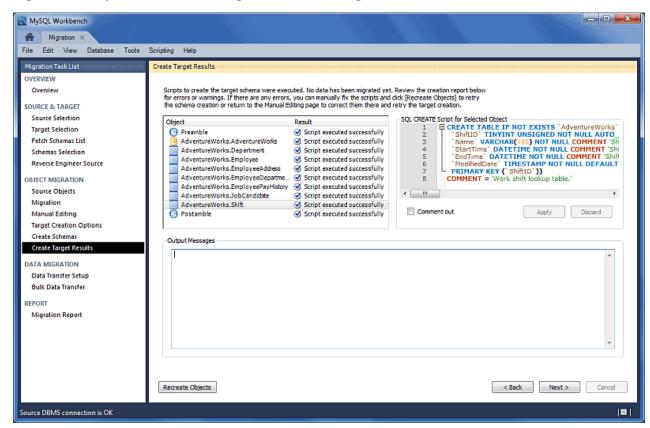

Figure 10.15 MySQL Workbench Migration: Create Target Results

## **Data Transfer Setup**

The next step transfers data from the source RDBMS to the target MySQL database. The setup screen includes the following options:

### Data Copy:

- Online copy of table data to target RDBMS: This method (default) will copy the data to the target RDBMS.
- Create a batch file to copy the data at another time: The data may also be dumped to a file that can be executed at a later time, or be used as a backup. This script uses a MySQL connection to transfer the data.
- Create a shell script to use native server dump and load abilities for fast migration: Unlike the simple batch file that performs a live online copy, this generates a script to be executed on the source host to then generate a Zip file containing all of the data and information needed to migrate the data locally on the target host. Copy and extract the generated Zip file on the target host and then execute the import script (on the target host) to import the data into MySQL using a LOAD DATA call.

This faster method avoids the need to traffic all data through MySQL Workbench, or to have a permanent network connection between the MySQL servers.

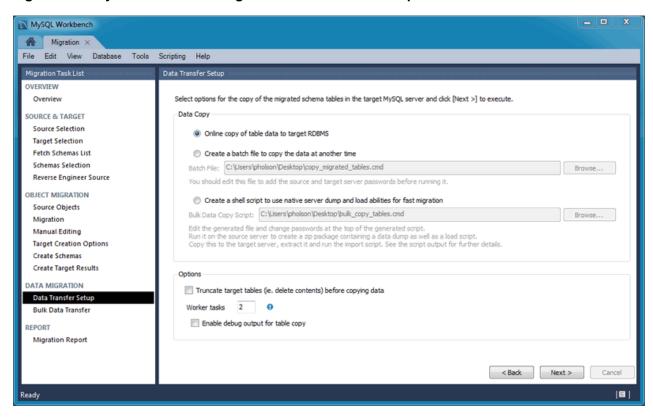

#### Note

This option was added in MySQL Workbench 6.3.0.

Options (see the figure that follows for an example):

- Truncate target tables before copying data: In case the target database already exists, this will delete said data.
- Worker tasks: The default value is 2. This is the number of tasks (database connections) used while copying the data.
- Enable debug output for table copy: Shows debugging information.

Figure 10.16 MySQL Workbench Migration: Data Transfer Setup

### **Bulk Data Transfer**

Depending on the selected option, this will either transfer the data to the target RDMS (default), generate a simple script for the online data transfer, or generate script to execute on the source host that then generates a Zip file containing both the transfer script and data that will be executed on the target host. Optionally, view the logs to confirm (see the figure that follows).

## **Migration Report**

And finally, the migration report is available and summarizes the entire migration process as depicted in the following figure.

Figure 10.18 MySQL Workbench Migration: Migration Report

Clicking **Finish** will close the migration window. If you chose the online copy then the database can now be viewed within the MySQL Workbench SQL editor as the following figure shows.

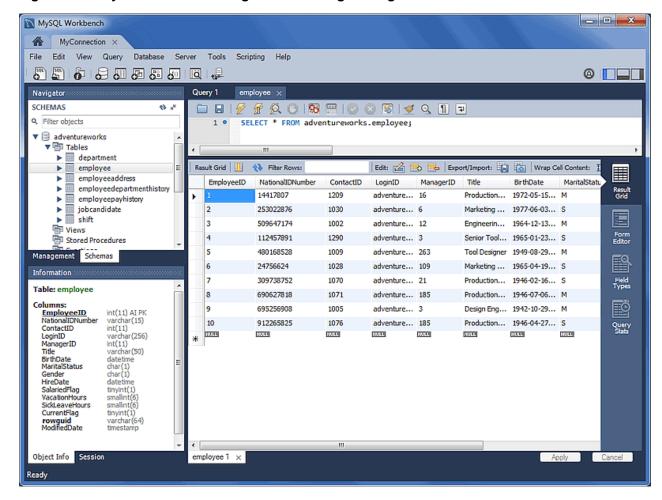

Figure 10.19 MySQL Workbench Migration: Viewing the Migrated Database

#### Note

If a MySQL Workbench SQL Editor tab is already opened, then the schema list within the Object Browser must be refreshed in order to view the newly imported schema.

## 10.2.2 Migrating from Supported Databases

When a supported RDBMS product is being migrated, the MySQL Workbench Migration Wizard will automatically convert as much information as it can, but you may still be required to manually edit the automatically migrated schema for difficult cases, or when the default mapping is not as desired.

Generally speaking, only table information and its data are automatically converted to MySQL. Code objects such as views, stored procedures, and triggers, are not. But supported RDBMS products will be retrieved and displayed in the wizard. You can then manually convert them, or save them for converting at a later time.

The following RDBMS products and versions are currently tested and supported by the MySQL Workbench Migration Wizard, although other RDBMS products can also be migrated with Section 10.2.3, "Migrating from Unsupported (Generic) Databases"

Microsoft SQL Server 2000, 2005, 2008, 2012

- · Microsoft Access 2007 and greater
- MySQL Server 4.1 and greater as the source, and MySQL Server 5.1 and greater as the target
- PostgreSQL 8.0 and greater
- · SQL Anywhere
- SQLite
- Sybase Adaptive Server Enterprise 15.x and greater

## 10.2.3 Migrating from Unsupported (Generic) Databases

Most ODBC compliant databases may be migrated using the generic database support. In this case, code objects will not be retrieved from the source database; only tables and data.

When using the generic support, column data types are mapped using the following steps:

- 1. It searches for the first entry in the **Generic Datatype Mapping Table** for the source type name. If the length/scale ranges of the entry matches the source column, it will pick that type. Otherwise, it continues searching.
- 2. If no matches were found in the generic table, then it tries to directly map the source type to a MySQL type of the same name.
- 3. If the source type name doesn't match any of the MySQL data types, then it is not converted and an error is logged. From here you can specify the target datatype in the **Manual Object Editing** step of the wizard.

### Handling Microsoft SQL Server and MySQL structural differences

A Microsoft SQL Server database is made up of one catalog and one or more schemas. MySQL only supports one schema for each database (or rather, a MySQL database is a schema) so this difference in design must be planned for. The Migration Wizard must know how to handle the migration of schemas for the source (Microsoft SQL Server) database. It can either keep all of the schemas as they are (the Migration Wizard will create one database per schema), or merge them into a single MySQL database. Additional configure options include: either remove the schema names (the Migration Wizard will handle the possible name collisions that may appear along the way), and an option to add the schema name to the database object names as a prefix.

# **10.4 Microsoft Access Migration**

#### Note

This feature was added in MySQL Workbench 6.2.0.

### **General Information**

Microsoft Windows is required because Microsoft Access ODBC drivers are only available on Windows. As for the destination MySQL server, you can have it in the same local machine or elsewhere in your network.

## **Preparing a Microsoft Access Database for Migration**

Microsoft Access stores relationship/foreign key information in an internal table called **MSysRelationships**. That table is protected against read access even to the Admin user, so if you try to migrate without opening up access to it, then you will get an error like this:

[42000] [Microsoft][ODBC Microsoft Access Driver] Record(s) cannot be read; no read permission on 'msysobj

The steps to grant read access to the Admin are explained below.

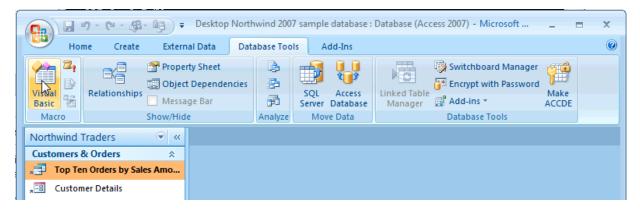

#### Note

The screen shots in this documentation use Microsoft Access 2007.

- · Open up database in Microsoft Access
- From the **Database Tools** ribbon, click the **Visual Basic** to open the Visual Basic (VB) console. The following figure shows the location of this button in the Macro area.

Figure 10.20 Locating the Visual Basic Macro Database Tool

- To confirm that you're logged in as the "Admin" user, locate the **Immediate** panel and type the "? CurrentUser" and press **Enter**. This should output "Admin" under "? CurrentUser" in the panel (see the figure that follows).
- Also in the **Immediate** panel, type the following command to grant access:

CurrentProject.Connection.Execute "GRANT SELECT ON MSysRelationships TO Admin"

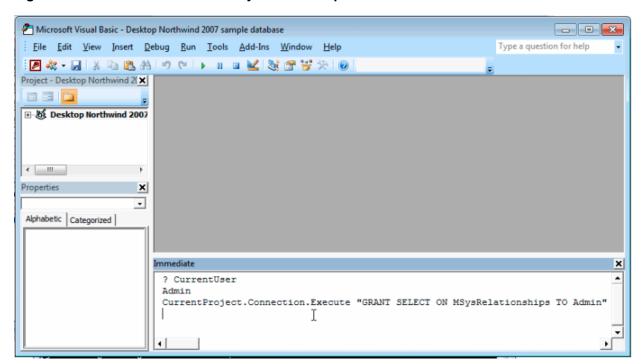

Figure 10.21 GRANT SELECT ON MSysRelationships TO Admin

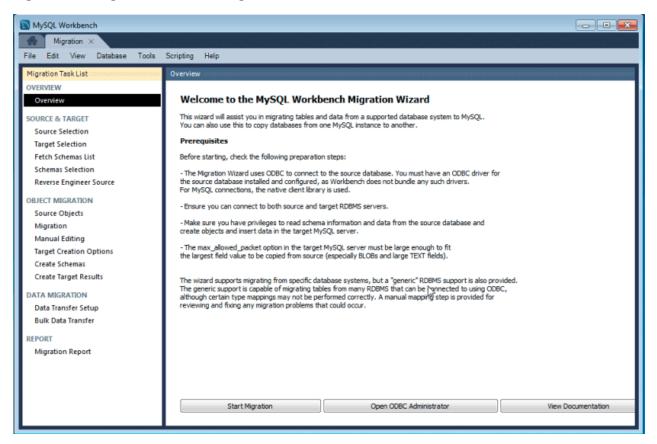

· Quit the Microsoft Access application

## Start the MySQL Workbench Migration Wizard

From the main MySQL Workbench screen you can start the Migration Wizard by clicking the database-

migration launcher ( ) in the Workbench side panel or by clicking **Database** and then **Migration Wizard** from the main menu. As the following figure shows, a new tab showing the Overview page of the Migration Wizard is displayed.

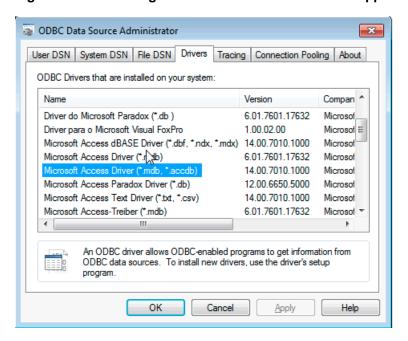

Figure 10.22 Migration Overview Page

## **Setting Up ODBC Drivers**

To verify that you have the ODBC driver installed, click **Open ODBC Administrator** from the MySQL Workbench migration overview page to open the system ODBC tool. Then, select the **Drivers** tab (see the figure that follows).

Figure 10.23 Checking the ODBC Drivers for Access Support

### **Important**

MySQL Workbench has both 32-bit and 64-bit executables. The ODBC drivers you use must be of the same architecture as the MySQL Workbench binaries you are using. Because Office 2007 and older was 32-bit only and even Office 2010 installs as 32-bit by default, you may need to install the 32-bit version of MySQL Workbench to migrate from Access, even if you have a 64-bit machine. If during migration you get an ODBC error about "architecture mismatch between the Driver and Application", you installed the wrong version of MySQL Workbench.

In the **User DSN** tab, click **Add** to create a DSN for your database file. As the next figure shows, a new data source was created for the northwind database sample.

Figure 10.24 Adding a New DSN

## **Setting Up Source Parameters**

Click **Start Migration** from the Overview page to advance to the **Source Selection** page. Here you need to provide the information about the Access database you are migrating from, the ODBC driver to use, and the parameters for the Access connection.

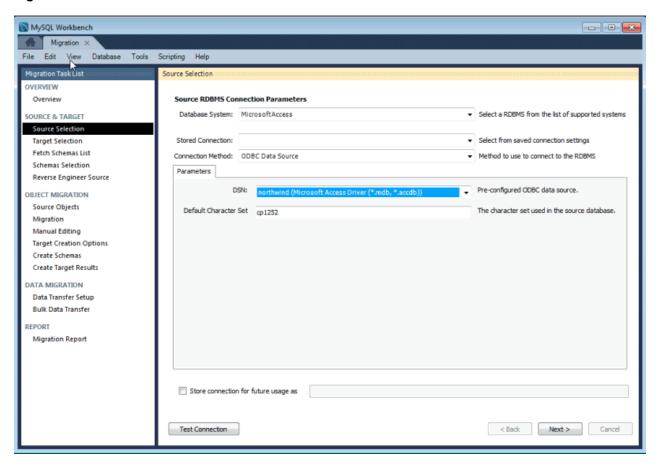

Open the **Database System** combo box for a list of supported RDBMSes, and select **Microsoft Access** from the list. There is another combo box below it named **Stored Connection**. It lists saved connection settings for that RDBMS. You can save connections by marking the check box at the bottom of the page, along with a name for the saved connection.

The next combo box selects the **Connection Method**. This time we are going to select *ODBC Data Source* from the list. This allows you to select pre-existing DSNs that you have configured in your system.

The **DSN** drop-down list will have all DSNs you have defined in your system. Pick the one you created for the Access database being migrated from the list.

In the **Default Character Set** field you can select the character set of your database (see the figure that follows). If your Access version uses western/latin characters, you can leave the default *cp1252*. However, if you use a localized version of Access, such as Japanese, you must enter the correct character set used by your edition of Microsoft Office, otherwise the data will be copied incorrectly.

Figure 10.25 Access Source Selection

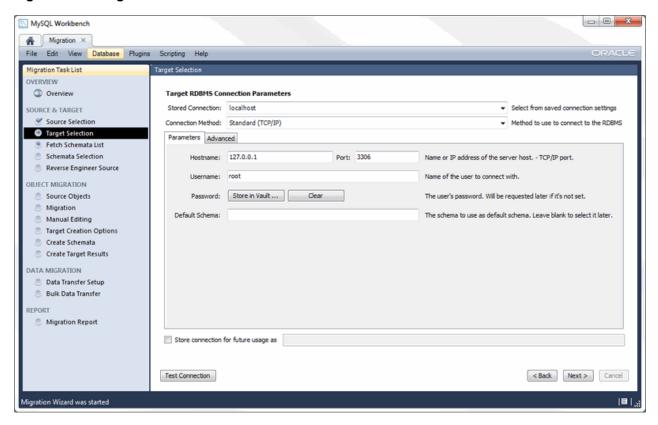

Lastly, click **Test Connection** to check whether an ODBC connection can be established. If you entered the correct parameters then you should see a message reporting a successful connection attempt.

# **Setting Up Target Parameters**

Next, set up the target (MySQL) database parameters by defining the parameters that connect to your MySQL Server instance. When finished, click **Test Connection** to verify the connection definition. The following figure shows the **Parameters** tab.

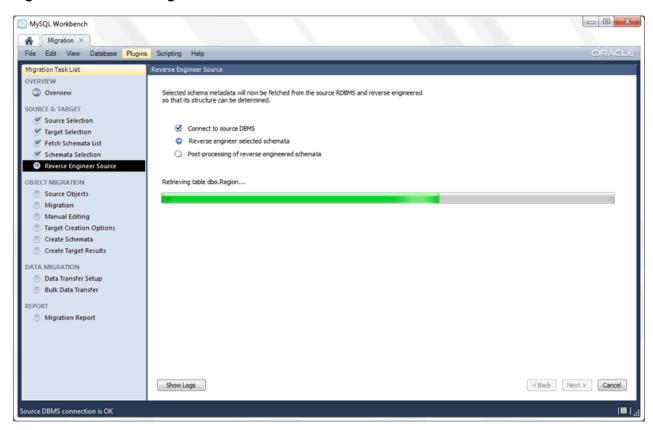

Figure 10.26 Target Database Selection

# **Select the Objects to Migrate**

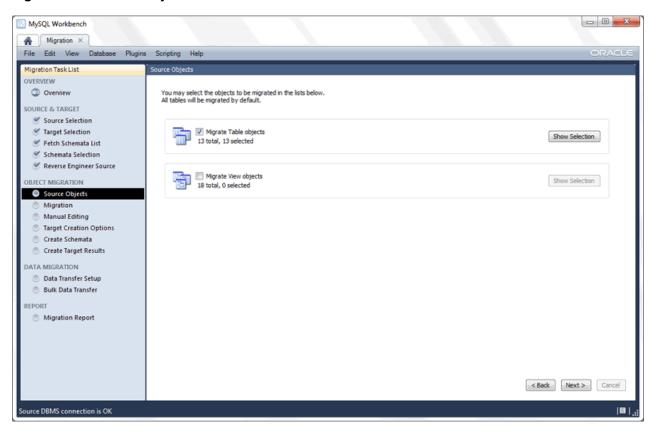

Next, you should see the reverse engineering of the selected database objects progress. At this point, the migration wizard is retrieving relevant information about the involved database objects (such as table names, table columns, primary and foreign keys, indexes, triggers, views, and more). You will be presented a page showing the progress as shown in the next figure.

Figure 10.27 Reverse Engineer Source

Wait for it to finish and verify that everything went well. Next, the **Source Objects** displays a list with the objects that were retrieved and are available for migration. It will look similar to the figure that follows.

Figure 10.28 Source Objects

In the previous example, the migration wizard discovered table and view objects for our source database. Only the table objects are selected by default for migration.

### Note

You can also select the view objects but you must also provide their corresponding MySQL equivalent code later (no automatic migration is available for them) so our example will leave the views unchecked. The same applies for stored procedures, functions and triggers.

Click Show Selection to configure exactly which objects you want to migrate, as the next figure shows.

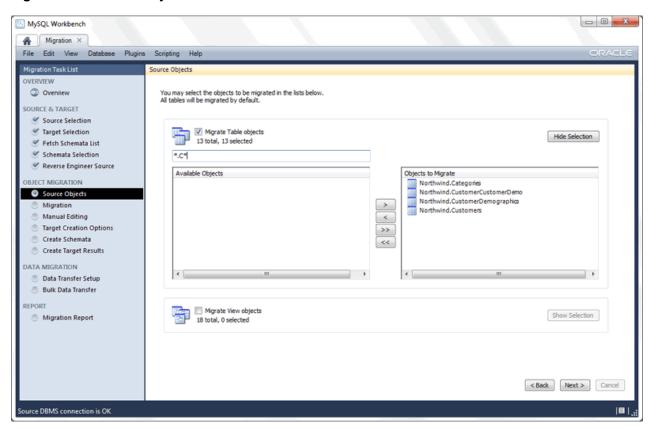

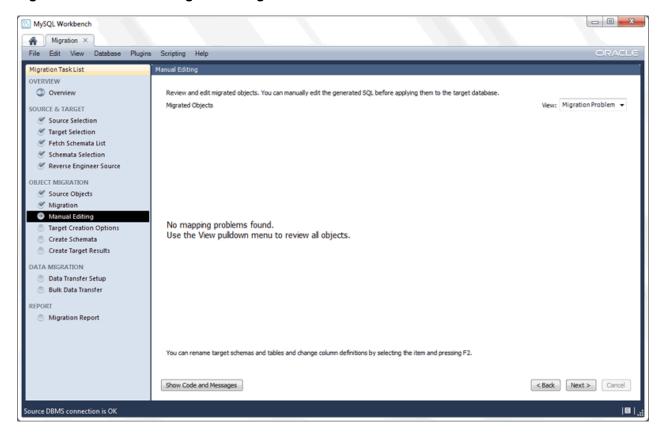

Figure 10.29 Source Objects Selection

The objects on the right will be migrated. The filter box can filter the list (wildcards are allowed, as demonstrated above). By using the arrow buttons you can filter out the objects that you do not want to migrate. Before continuing, clear the filter text box to check the full list of the selected objects. Our example migrates all of the table objects so all of them are in the **Objects to Migrate** list, and the **Migrate Table Objects** check box is checked.

## **Review the Proposed Migration**

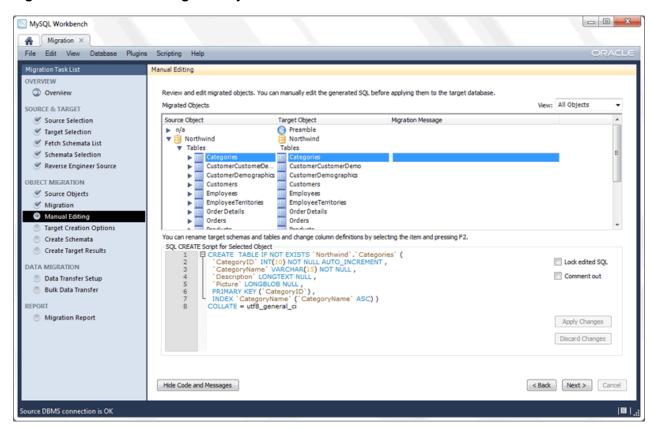

At this point, the migration wizard converts the selected objects into their equivalent objects into the target MySQL server, and it also generates the MySQL code needed to create them. You might have to wait before the **Manual Editing** step displays the initial page shown in the next figure.

Figure 10.30 Manual Editing: Initial Page

The **View** combo box changes the way the migrated database objects are shown (see the figure that follows). Click **Show Code** to view and edit the generated MySQL code that corresponds to the selected object. Additionally, you can double-click on a row in the object tree to edit the object name, or double-click the database row to change its name.

Figure 10.31 Manual Editing: All Objects

The **View** combo box also has a **Column Mappings** option. As the following figure indicates, it shows the table columns and allows you to review and fix the mapping of column types, default values, and other attributes.

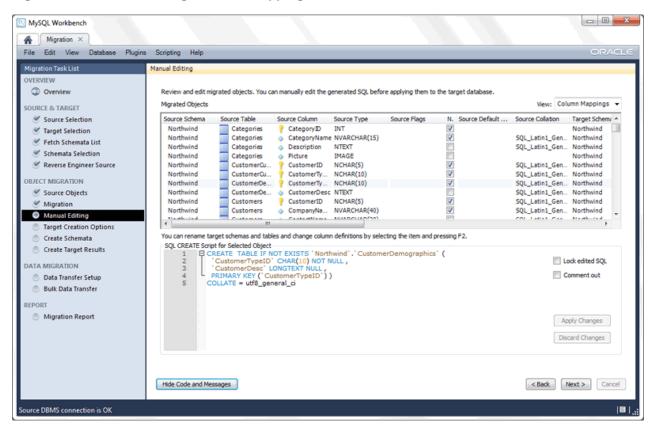

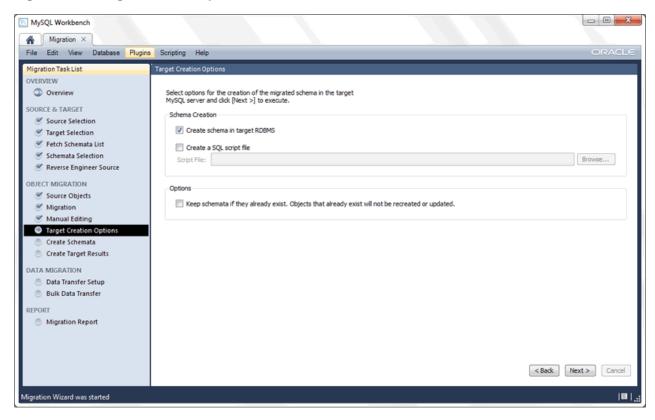

Figure 10.32 Manual Editing: Column Mappings

## **Create the Database Objects**

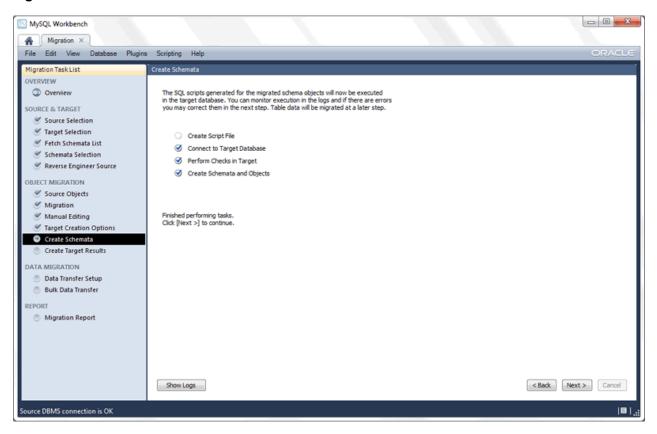

Next is the **Target Creation Options** page, as shown in the following figure.

**Figure 10.33 Target Creation Options** 

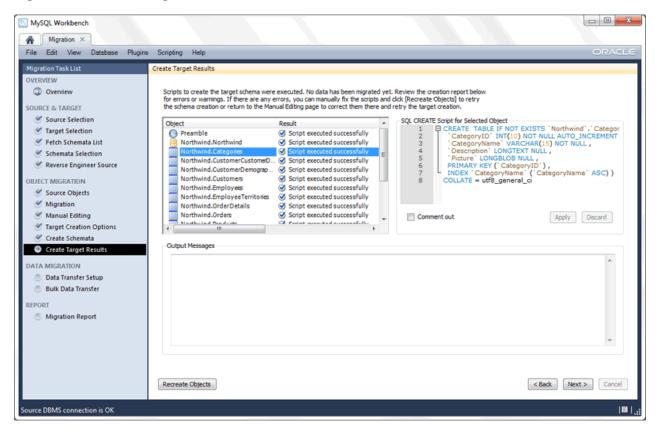

Use target-creation options to execute the generated code in the target RDBMS (your MySQL instance from the second step) or you can dump it to an SQL script file. Leave it as shown in the previous figure and move to the next page. The migrated SQL code will be executed on the target MySQL server. You can view its progress in the **Create Schemas** page shown in the next figure.

Figure 10.34 Create Schemas

When the creation of the schemas and objects finishes, you can move to the **Create Target Results** page. It presents a list of created objects and includes any generated errors while they were created. It will look similar to the following figure.

Figure 10.35 Create Target Results

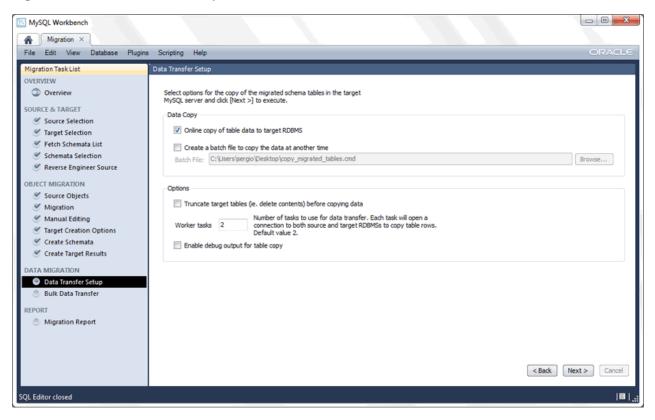

You can edit the migration code using the code box to the right, and save your changes by clicking **Apply**. If edits were made, you still need to recreate the objects with the modified code in order to perform the changes. This is done by clicking **Recreate Objects**. In this tutorial we are not changing anything, so leave the code as it is, and continue on to the **Data Transfer Setup** page.

# Transfer the Data to the MySQL Database

The next step transfers data from the source Access database into your newly created target MySQL database. The Data Transfer Setup page allows you to configure this process (see the figure that follows).

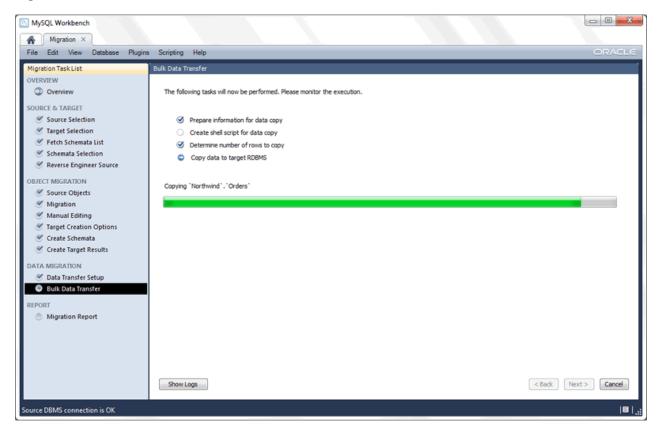

Figure 10.36 Data Transfer Setup

There are two sets of options here. The first allows you to perform a live transference and/or to dump the data into a batch file that you can execute later. The other set of options allows you to alter this process.

This tutorial uses the default values for the options in this page as shown in the previous figure. Next, the data is transferred. At this point the corresponding progress page confirms the tasks being performed (see the figure that follows).

Figure 10.37 Bulk Data Transfer

Once it finishes, move to the next page. You will be presented a report page summarizing the whole process. Now, review and click **Finish** to close the wizard.

### Verification

Now that the northwind database was successfully migrated, you can view the results. Open an SQL Editor that is associated with your MySQL server instance and then query the northwind database. For example, execute a query like SELECT \* FROM northwind.customers, which populates the result grid as shown in the next figure.

# 10.5 Microsoft SQL Server Migration

18

The MySQL Workbench Migration Wizard is tested against the following Microsoft SQL Server versions: 2000, 2005, 2008, and 2012.

Autier Micon

Catherine

K

Appl

## 10.5.1 Preparations

To be able to migrate from Microsoft SQL Server, ensure the following:

• The source SQL Server instance is running, and accepts TCP connections.

Company R

- You know the IP and port of the source SQL server instance. If you will be migrating using a Microsoft ODBC driver for SQL Server (the default in Windows), you will need to know the host and the name of the SQL Server instance.
- Make sure that the SQL Server is reachable from where you will be running MySQL Workbench. More specifically, check the firewall settings.
- Make sure that the user account has proper privileges to the database that will be migrated.

### **10.5.2 Drivers**

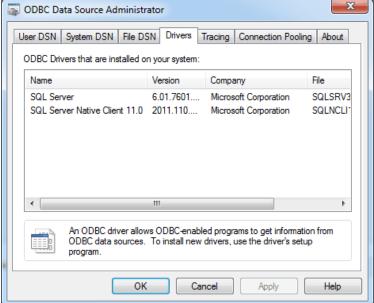

Microsoft Windows does not require additional drivers to be installed and configured, but Linux (and macOS) do. The following sections include specific instructions for each type of system.

### 10.5.2.1 Microsoft Windows

Microsoft Windows XP and newer includes at least one ODBC driver for Microsoft SQL Server, so additional actions are likely not required on your system. Multiple SQL Server driver options exist, as described in this section.

You can check your ODBC driver information by starting the Windows ODBC Data Source Administrator that is linked from the MySQL Workbench migration wizard's home page. Alternatively, open a Windows terminal and execute odbcad32.exe. Open the **Drivers** tab to see something similar to the following figure.

Figure 10.39 Windows ODBC Data Source Administrator: SQL Server Drivers

Common ODBC drivers available on Windows are:

- **SQL Driver**: preinstalled on Windows, but is limited to the functionality provided by SQL Server 2000. It functions okay if your database does not use features and data types introduced after SQL Server 2000, so it should be enough for you if your database does not make use of the new features and data types introduced after this SQL Server version.
- SQL Server Native Client XX.X: if you have an SQL Server instance on the same machine as MySQL Workbench, then you will also have this additional driver. This comes with SQL Server and fully supports the companion SQL Server version. If this is not on your system then you can download and install this it from Microsoft. For example, download the Microsoft SQL Server 2014 Feature Pack to install the Native Client that supports SQL Server 2014 and earlier.

#### Note

XX.X represents the major version number for SQL Server, so an actual name might be "SQL Server Native Client 11.0".

Decide which driver you want to use, and remember its name as shown in the ODBC Data Source Administrator. This specific name is used in MySQL Workbench to connect your SQL Server instance.

Jump to the documentation titled Section 10.5.3, "Connection Setup".

### 10.5.2.2 Linux

Setting up drivers on Linux.

#### **FreeTDS**

FreeTDS version 0.92 or greater is required. Many distributions ship older versions of FreeTDS, so it may need to be installed separately. Additionally, the FreeTDS version provided by distributions may also be compiled for the wrong ODBC library (usually to unixODBC instead of iODBC, which MySQL Workbench uses). Because of that, you will probably need to build this library yourself.

A script is provided to compile FreeTDS using the options required for MySQL Workbench. You can find it at /usr/share/mysql-workbench/extras/build\_freetds.sh on Linux or MySQLWorkbench.app/Contents/SharedSupport/build\_freetds.sh on macOS. To use it, follow these steps:

#### Using FreeTDS with iODBC

When compiling FreeTDS for use with iODBC (the default with the official binaries), it must be compiled with the --enable-odbc-wide command line. Failing to do so will result in crashes and other unpredictable errors. The provided build\_freetds.sh script does this for you.

1. For compiling, make sure you have the iODBC headers installed. For Linux, the name depends on your system's package manager but common names are libiodbc-devel (RPM based systems) or libiodbc2-dev (Debian based systems). For macOS, the headers come with the system and no additional action is required for this step.

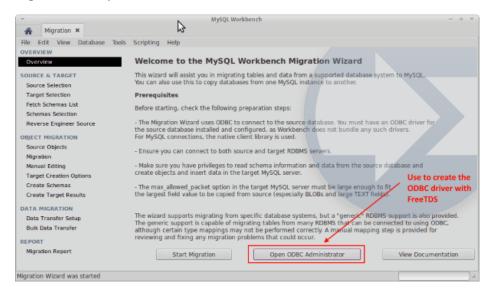

#### Note

If you are using Oracle Enterprise Linux, RedHat, CentOS, and similar, you must have the EPEL repository set up in yum for it to find the <code>libiodbc-devel</code> package. For additional information about this step, see <a href="Installing Oracle">Installing Oracle</a> Enterprise Linux and similar.

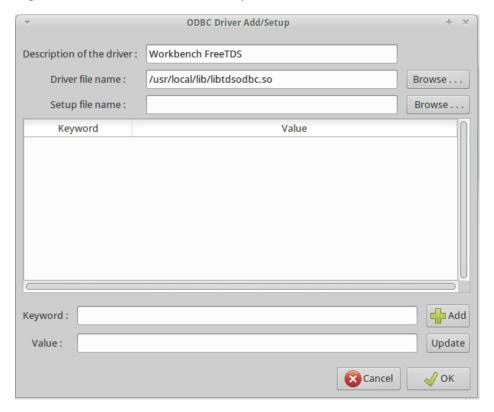

- 2. mkdir ~/freetds to create a directory within the users home directory.
- 3. Copy the build\_freetds.sh script to ~/freetds
- 4. Get the latest FreeTDS sources from ftp://ftp.freetds.org/pub/freetds/ and place the .tar.gz source file into the ~/freetds directory. Make sure to get FreeTDS version 0.92 or newer.
- 5. cd ~/freetds
- 6. Execute build\_freetds.sh
- 7. After compilation is done, install it using make install from the path given by the script.
- 8. Install the driver using ODBC Administrator so that the ODBC subsystem recognizes it. Open ODBC Administrator from the migration tab in MySQL Workbench (see the figure that follows).

Figure 10.40 Open the ODBC Administrator

The name of the driver file is libtdsodbc.so and it is located in /usr/lib or /usr/local/lib. For example, under the **ODBC Drivers** tab click **Add Driver** and fill out the description (name) and path to the driver file (see the figure that follows). Remember the name you define here as it will be needed later on. Save the driver.

Figure 10.41 ODBC Driver Add/Setup

#### Note

Only the driver file name is required, while the setup file name can remain undefined.

9. Close the ODBC Administrator and click **Start Migration**. For information about making a Microsoft SQL Server connection using the MySQL Workbench migration wizard, see Section 10.5.3.2, "Linux".

#### 10.5.2.3 macOS

See the FreeTDS setup notes for Linux, Section 10.5.2.2, "Linux".

## 10.5.3 Connection Setup

This section focuses on creating a connection to the source Microsoft SQL Server, because creating a MySQL connection is a standard operation.

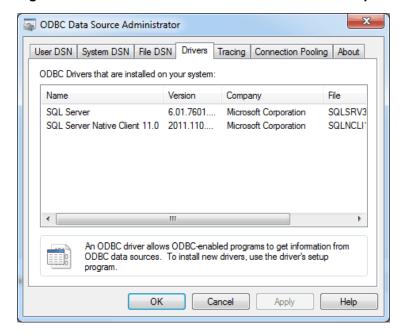

#### Note

Prerequisite: that you already installed and configured the required Microsoft SQL Server driver on the system running MySQL Workbench.

#### 10.5.3.1 Microsoft Windows

Select **Microsoft SQL Server** as the database system and fill out the remaining options as described in this section. The following figure shows an example of the **Drivers** tab.

Figure 10.42 SQL Server Connection Parameters Example on Windows

- Database System: Microsoft SQL Server
- Connection Method: choose ODBC (native) to use the native ODBC driver that is provided by Microsoft. Alternatives include "ODBC data sources" and "ODBC FreeTDS". FreeTDS is a popular open source driver for SQL Server and Sybase.

- **Driver**: use the SQL Server driver name, as described in the documentation titled Section 10.5.2.1, "Microsoft Windows". Typically this will be "SQL Server" or a versioned client, such as "SQL Server" Native Client 11.0".
- Server: the address and optionally instance name of the SQL server, such as "example.com" or "example.org\SQLEXPRESS".
- Username: the user name on the SQL Server, with "sa" being a commonly used name.
- Password: optionally enter a password to save locally, or leave it blank to enter the password when the SQL Server connection is made later on in the process.
- Database: optionally enter a database name. Leave it blank to select a database name after the MySQL Workbench wizard fetches the available databases.
- · Store connection for future: optionally store the connection details locally for future use by checking this box and entering a name for the connection.
- Advanced: optionally enter additional options.

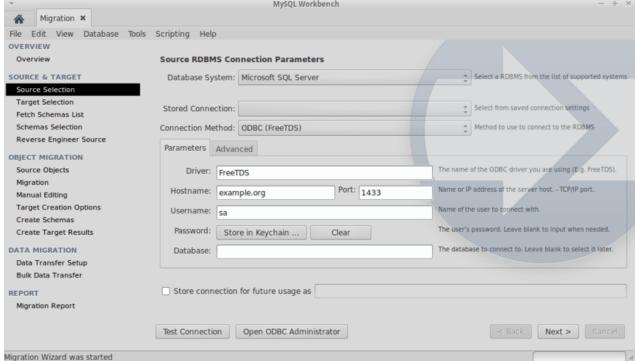

Click **Test Connection** to confirm that the parameters are correct before moving on.

#### 10.5.3.2 Linux

Select Microsoft SQL Server as the source database system and fill out the remaining options as described in this section. The following figure shows an example of the connection parameters.

MySQL Workbench Migration × File Edit View Database Tools Scripting Help

Figure 10.43 SQL Server Connection Parameters Example on Linux

Source RDBMS connection parameters include:

Database System: Microsoft SQL Server

 Connection Method: choose ODBC (FreeTDS) to use the local FreeTDS that was installed in an earlier step. For additional information about how to install a FreeTDS driver on Linux that will work with the MySQL Workbench migration wizard, see Section 10.5.2.2, "Linux".

Alternatively, choose **ODBC Data Source (FreeTDS)** if you defined a DSN when creating the SQL Server driver. The available pre-configured DSN options will be available to choose from.

• **Driver**: The name of the driver that you created with the ODBC Administrator, as described in the documentation titled Section 10.5.2.2, "Linux".

An example name might be "Workbench FreeTDS", or "FreeTDS", but it is the name you defined in an earlier step, so it may or may not be "FreeTDS". Use the ODBC Administrator to find the correct driver name, as otherwise the connection will fail.

- Hostname: the address and instance name of the SQL server, such as "example.org".
- Port: the port number. Port number 1433 is commonly used for MySQL server.
- Username: the user name on the SQL server, with "sa" being a commonly used name.
- **Password**: optionally enter a password to save locally, or leave it blank to enter the password when the SQL Server connection is made later on in the process.
- Database: optionally enter a database name. Leave it blank to select a database name after the MySQL Workbench wizard fetches the available databases.
- Store connection for future: optionally store the connection details locally for future use by checking this box and entering a name for the connection.
- Advanced: Deselect the Driver sends Unicode data as UTF-8 option to use UCS-2.

#### Note

If your MSSQL server connection succeeded but the data import failed, it could be because this setting was enabled.

Click **Test Connection** to confirm that the parameters are correct before moving on.

### 10.5.3.3 macOS

Connection parameters are similar to Linux, see Section 10.5.3.2, "Linux".

# 10.6 PostgreSQL migration

# 10.6.1 Preparations

Before proceeding, you will need the following:

- Follow the installation guide for installing iODBC on your system. For more information, see Section 10.1, "General Installation Requirements".
- Access to a running PostgreSQL instance with privileges to the database you want to migrate, otherwise known as the "source database." The Migration Wizard officially supports PostgreSQL 8.0 and above, although older versions may work.
- Access to a running MySQL Server instance with privileges to the database you want to migrate. The Migration Wizard officially supports MySQL 5.0 and above.

#### **10.6.2 Drivers**

#### 10.6.2.1 Microsoft Windows

Download and install the MSI package for psqIODBC. Choose the newest file from <a href="http://www.postgresql.org/ftp/odbc/versions/msi/">http://www.postgresql.org/ftp/odbc/versions/msi/</a>, which will be at the bottom of the downloads page. This will install psqIODBC on your system and allow you to migrate from Postgresql to MySQL using MySQL Workbench.

#### 10.6.2.2 Linux

After installing iODBC, proceed to install the PostgreSQL ODBC drivers.

Download the psqlODBC source tarball file from http://www.postgresql.org/ftp/odbc/versions/src/. Use the latest version available for download, which will be at the bottom of the downloads page. The file will look similar to psqlodbc-09.03.0400.tar.gz. Extract this tarball to a temporary location, open a terminal, and cd into that directory. The installation process is:

```
shell> cd the/src/directory
shell> ./configure --with-iodbc --enable-pthreads
shell> make
shell> sudo make install
```

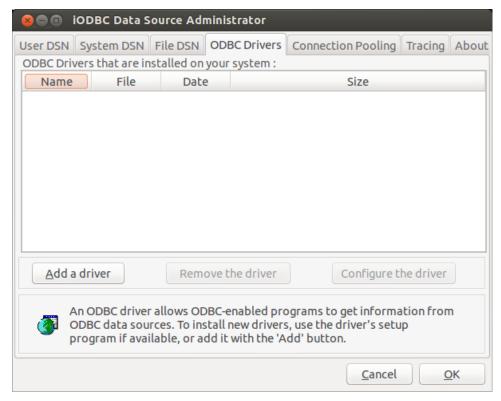

Verify the installation by confirming that the file psqlodbcw.so is in the /usr/local/lib directory.

Next, you must register your new ODBC Driver.

Open the iODBC Data Source Administrator application by either executing iodbcadm-gtk in the command-line, or by launching it from the Overview page of the MySQL Workbench Migration Wizard by clicking the Open ODBC Administrator button.

Go to the **ODBC Drivers** tab in the iODBC Data Source Administrator. It should look similar to the example in the figure that follows.

Figure 10.44 The iODBC Data Source Administrator

Click **Add a driver** then fill out the form with the following values:

- Description of the driver: psqlODBC
- **Driver file name**: /usr/local/lib/psqlodbcw.so
- Setup file name: No value is needed here

And lastly, clicking **OK** will complete the psqlodbc driver registration.

#### 10.6.2.3 macOS

To compile psqlodec on macOS, you will need to have Xcode and its "Command Line Tools" component installed on your system, as this includes the required gcc compiler. Xcode is free, and available from the AppStore. And after installing Xcode, open it and go to **Preferences**, **Downloads**, **Components**, and then install the "Command Line Tools" component.

Download the psqlODBC source tarball file from http://www.postgresql.org/ftp/odbc/versions/src/. Use the latest version available for download, which will be at the bottom of the downloads page. The file will look similar to psqlodbc-09.03.0400.tar.gz. Extract this tarball to a temporary location, open a terminal, and cd into that directory. The installation process is:

shell> cd the/src/directory

```
shell> ./configure --with-iodbc --enable-pthreads
shell> CFLAGS="-arch i386 -arch x86_64" make
shell> sudo make install
```

## 10.6.3 Connection Setup

After loading the Migration Wizard, click on the **Start Migration** button in the **Overview** page to begin the migration process. You will first connect to the source PostgreSQL database. Here you will provide the information about the PostgreSQL RDBMS that you are migrating from, the ODBC driver that will be used for the migration, and all of the parameters required for the connection. The name of the ODBC driver is the one you set up when you registered your psqlODBC driver with the driver manager.

Opening the **Database System** dropdown will reveal each RDBMS that is supported on your system. Select PostgreSQL from the list. Below that is the **Stored Connection** dropdown, which is optional. Stored connections will be listed here, which are connections saved after defining a connection with the **Store connection for future use as** checkbox enabled.

The three Connection Method options are:

- ODBC (manually entered parameters): Each parameter, like a username, is defined separately
- ODBC Data Source: For pre-configured data sources (DSN) -- you can optionally create a DSN using the ODBC Administrator
- ODBC (direct connection string): A full ODBC connection string

#### Note

The psqlODBC driver does not allow a connection without specifying a database name.

The migration process is similar to other databases. See Section 10.6.4, "PostgreSQL Type Mapping" for information on how the migration wizard migrates types from PostgreSQL to MySQL, and Section 10.2.1, "A Visual Guide to Performing a Database Migration" for a general migration guide.

# 10.7 MySQL Migration

Perform MySQL server version upgrades to move off older MySQL versions to the latest version. The standard migration wizard can migrate MySQL to MySQL, and a simpler **Schema Transfer Wizard** can also be used.

# MySQL Schema Transfer Wizard

The MySQL Schema Transfer wizard helps you move your data from an older MySQL server version to a different (typically later) MySQL version. This migration tool is meant for developer hosts as it is simpler than the standard migration wizard, because it only migrates MySQL to MySQL. The data is transferred and not based on a consistent snapshot, so it works best on local MySQL instances.

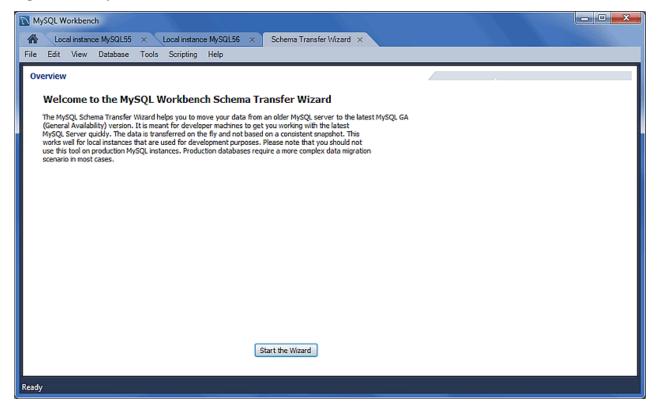

#### Note

You should not use this wizard on production MySQL instances.

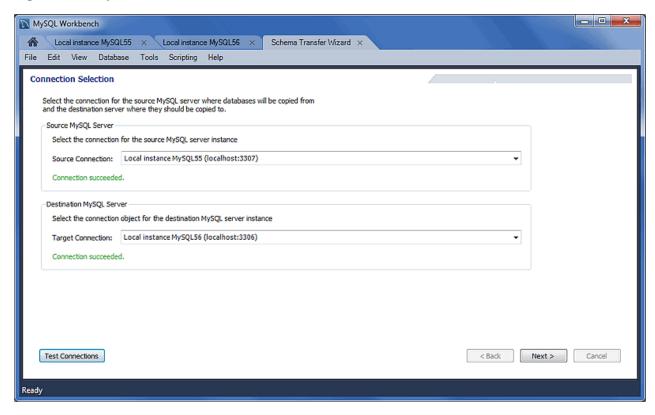

To open the wizard, select **Database** and then **Schema Transfer Wizard** from the main menu. The next figure shows the initial screen.

Figure 10.45 MySQL Schema Transfer Wizard: Overview

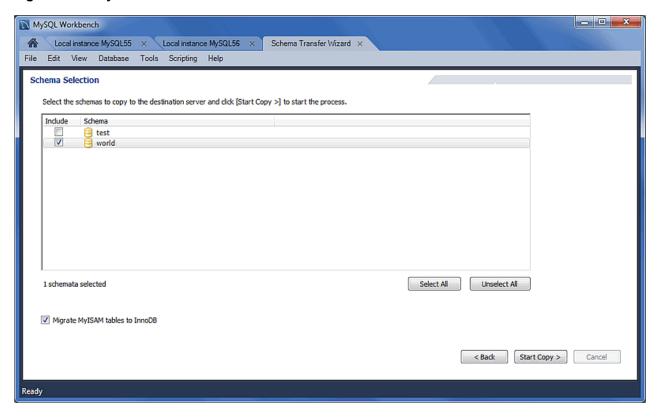

Read the overview text and click **Start the Wizard** to begin. An example transfer appears in the figure that follows.

Figure 10.46 MySQL Schema Transfer Wizard: Connection Selection

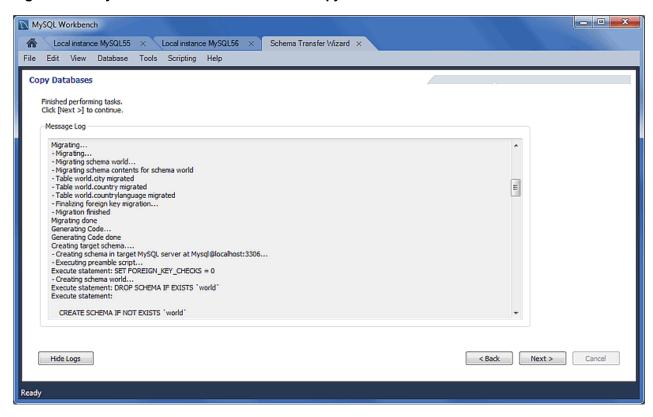

Choose your target and source MySQL connections (see the figure that follows). After choosing and testing your MySQL connections, click **Next** to continue.

Figure 10.47 MySQL Schema Transfer Wizard: Schema Selection

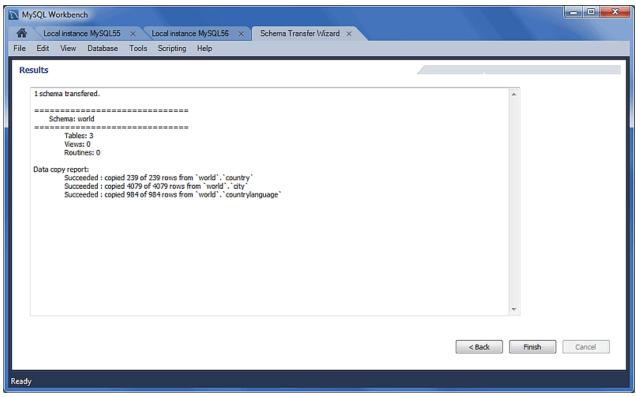

Choose the schemas to migrate, and click **Start Copy** to begin copying the selected schemas from the source to target MySQL server. The next figure shows the copy status.

Figure 10.48 MySQL Schema Transfer Wizard: Copy Databases

Review the **Message Log** to confirm that the migration finished with success. Click **Next** to view a summary of the results. The following figure shows an example of the copy results.

Figure 10.49 MySQL Schema Transfer Wizard: Results

Click Finish to close the wizard.

# 10.8 Using the MySQL Workbench Migration Wizard

For a visual walk-through of the migration wizard, see Section 10.2.1, "A Visual Guide to Performing a Database Migration".

# 10.8.1 Connecting to the Databases

A connection is made to the source and target database servers.

#### **Source Connection**

Select the source RDBMS that is migrating to MySQL. Choose the **Database System** that is being migrated and the other connection parameters will change accordingly (see the figure that follows).

#### Note

This connection definition may be saved using the Store connection for future use as option, and there is also the **Test Connection** option.

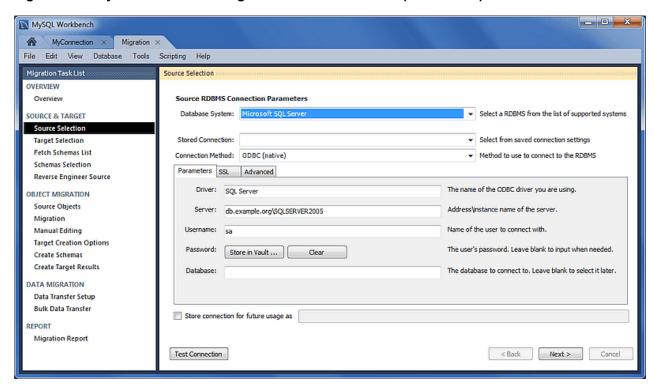

Figure 10.50 MySQL Workbench migration: Source Selection (Parameters)

## **Target Selection**

The target is the MySQL database that will contain the migrated data. Choose an existing MySQL Workbench connection or select **Manage Stored Connections** from drop-down list to create a new MySQL connection. An example stored connection appears in the following figure.

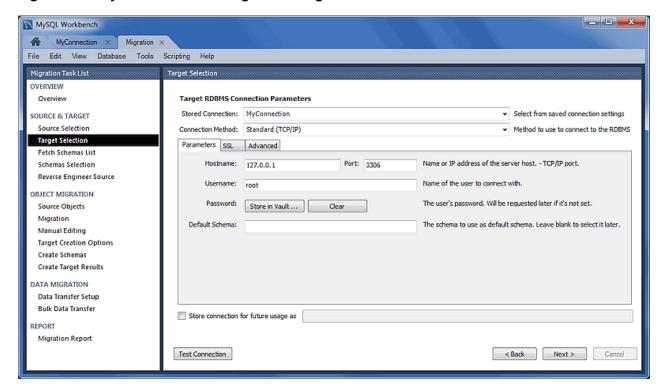

Figure 10.51 MySQL Workbench migration: Target selection

## 10.8.2 Schema Retrieval and Selection

Retrieve a list of available databases and choose the specific databases (and tables) that you want to migrate to MySQL.

#### **Fetch Schemas List**

The Schemas list is retrieved from both the source and target RDBMS. The account used for the connection will need to have appropriate privileges for listing and reading the schemas you want to migrate. Target RDBMS connection settings will also be validated. This is an automated and informational step that reports connection related errors, general log information, or both (see the figure that follows).

The steps that are performed include: connects to the source DBMS, checks the connection, and retrieves the schema list from the source.

#### **Schemas Selection**

Choose the databases you want to migrate over to MySQL.

The **Schema Name Mapping Method** step provides the following options for migrating from Microsoft SQL Server:

#### Note

This example uses Microsoft SQL Server as the source RDMS. Although the options will be different for other database systems, the concept remains the same.

- Keep schemas as they are: Catalog.Schema.Table -> Schema.Table: This will create multiple databases, one per schema.
- Only one schema: Catalog.Schema.Table -> Catalog.Table: Merges each schema into a single database (see the figure that follows).
- Only one schema, keep current schema names as a prefix: Catalog.Schema.Table ->
   Catalog.Schema table: Preserves the schema name as a prefix.

# 10.8.5 Migration

Reverse engineered objects from the source RDBMS are automatically converted to MySQL compatible objects. Default data type and default column value mappings are used, and the generated objects and column definitions may be reviewed and edited in the next step.

The steps performed include Migrating the selected objects, and generating the SQL CREATE statements, as indicated in the next figure.

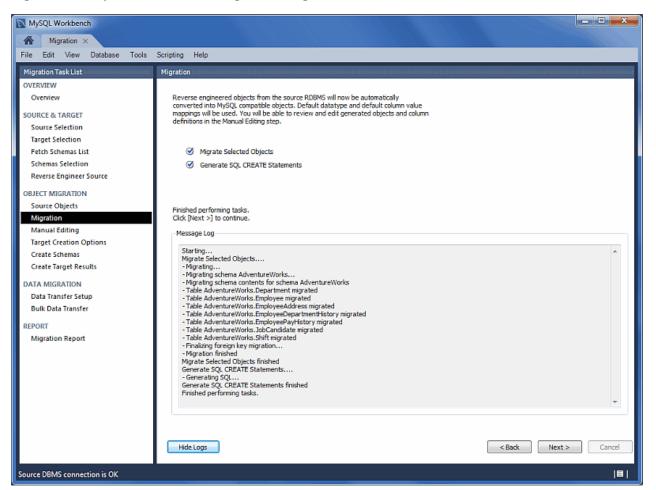

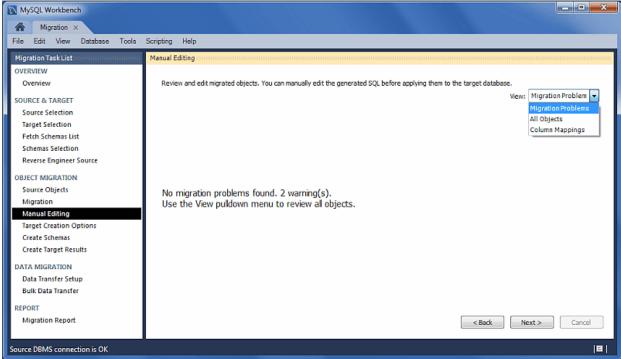

Figure 10.56 MySQL Workbench Migration: Migration

# 10.8.6 Manual Editing

Use the **View** select box to choose the section to edit (see the figure that follows). The **Show Code and Messages** button is available on every page and it shows the generated MySQL code that corresponds to the selected object.

• **Migration Problems**: This either reports problems or displays "No mapping problems found." As the following figure shows, this is an informational screen.

# 10.8.7 Target Creation Options

Defines addition settings for the target schema. Configuration options include:

- Create schema in target RDBMS
- · Create an SQL script file
- Keep the schemas if they already exist. Objects that already exist will not be recreated or update.

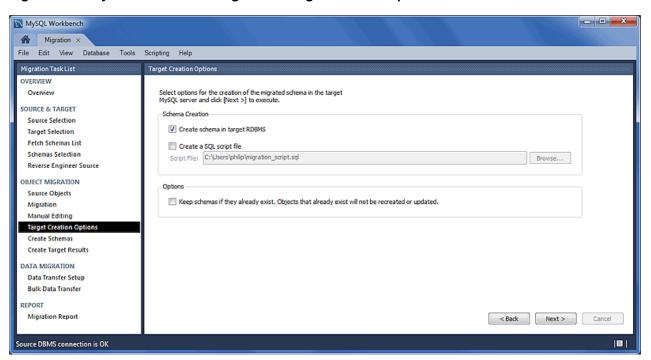

Figure 10.60 MySQL Workbench Migration: Target Creation Options

## 10.8.8 Schema Creation

The SQL scripts generated for the migrated schema objects will now be executed in the target database. You can monitor execution in the logs, if errors exist then they will be fixed in the next step. Table data will be migrated in a later step as well.

As the following figure shows, this is an automated step and the actions include: Create Script File, Connect to Target Database, and Create Schemas and Objects.

The migration code may also be viewed and edited here (see the figure that follows). To make changes, select an object, edit the query code, and click **Apply**. Repeat this process for each object that will be edited. Finally, click **Recreate Objects** to save the results.

#### Note

The **Recreate Objects** operation is required to save any changes here. It will then execute the previous migration step (**Create Schemas**) with the modified code, and then continue the migration process. This also means that the previously saved schema will be dropped.

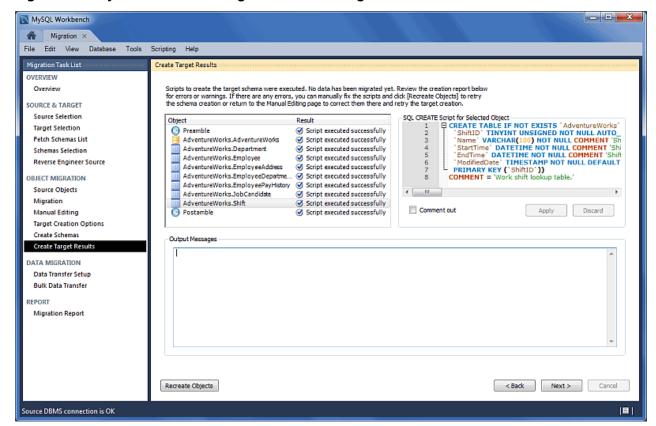

Figure 10.62 MySQL Workbench Migration: Create Target Results

# 10.8.10 Data Transfer and Migration Setup

Transfers data from the source RDBMS to the target MySQL database (see the figure that follows). The setup screen includes the following options:

#### Data Copy:

- Online copy of table data to target RDBMS: This (default) will copy the data to the target RDBMS.
- Create a batch file to copy the data at another time: The data may also be dumped to a file that can
  be executed at a later time, or be used as a backup. This script uses a MySQL connection to transfer the
  data.
- Create a shell script to use native server dump and load abilities for fast migration: Unlike the
  simple batch file that performs a live online copy, this generates a script to be executed on the source
  host to then generate a Zip file containing all of the data and information needed to migrate the data
  locally on the target host. Copy and extract the generated Zip file on the target host and then execute the
  import script (on the target host) to import the data into MySQL using a LOAD DATA call.

This faster method avoids the need to traffic all data through MySQL Workbench, or to have a permanent network connection between the MySQL servers.

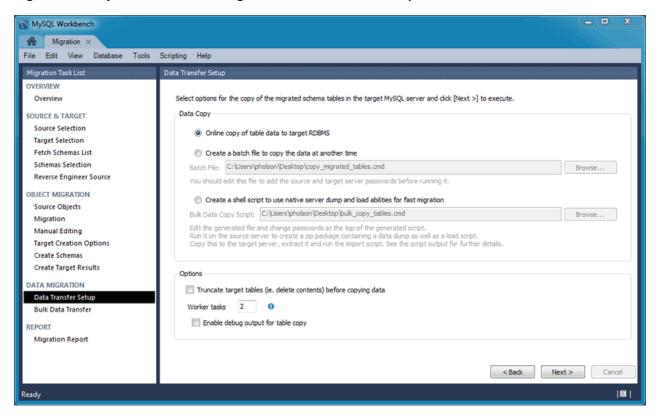

#### Note

This option was added in MySQL Workbench 6.3.0.

#### Options:

- Truncate target tables before copying data: In case the target database already exists, this will delete said data.
- Worker tasks: The default value is 2. This is the number of tasks (database connections) used while copying the data.
- Enable debug output for table copy: Shows debugging information.

Figure 10.63 MySQL Workbench Migration: Data Transfer Setup

### 10.8.11 Bulk Data Transfer

Depending on the selected option, this will either transfer the data to the target RDMS (default), generate a simple script for the online data transfer, or generate script to execute on the source host that then generates a Zip file containing both the transfer script and data that will be executed on the target host. Optionally, view the logs to confirm (see the figure that follows).

#### **Basic Usage**

A.1 What is a MySQL connection? Why might I need to create more than one?	415
A.2 Does MySQL Workbench support the TLSv1.2 protocol?	415
A.3 How do I create a MySQL database (schema) in MySQL Workbench?	415
A.4 Is there an easy way to select all data from a table, and then see the results?	416

A.1. What is a MySQL connection? Why might I need to create more than one?

A MySQL connection links (connects) Workbench to a MySQL server. Most actions performed within Workbench are then performed against the connected MySQL server. Each MySQL connection contains its own set of definitions, so you might define multiple MySQL connections in Workbench. For example, the connections might connect to different MySQL servers, or the same MySQL server with different user names, or enable SSL for one, or you might set up a connection to a remote MySQL server (on your web host?) using the SSH options, and so on.

As for multiple connections to the same local MySQL server, you might have one connection using "root" with another using a less privileged user. Depending on how you set up the users, they may (or may not) both have rights to see and use the same databases (information). For example, you might use Workbench to configure and use the less-privileged user that you use for your web application.

So to summarize, connections simply connect to the MySQL server. If two connections use the same exact information then the results in Workbench will be identical. However, that is not a common use case. For additional information about MySQL connections in MySQL Workbench, see Chapter 5, Connections in MySQL Workbench.

A.2. Does MySQL Workbench support the TLSv1.2 protocol?

Because TLSv1.2 requires OpenSSL, support for this protocol is available for MySQL Workbench Commercial Editions, and not for the Community Edition (which is compiled using yaSSL and supports TLSv1.1 only).

- A.3. How do I create a MySQL database (schema) in MySQL Workbench?
  - Open a MySQL connection to open the SQL editor.
  - On the left pane there is an Object Browser that contains two tabs titled Management and Schemas. Choose the schemas tab (default).
  - Right-click anywhere in the Schemas pane and choose Create Schema from the context-menu.
  - Follow the schema creation wizard by naming your new schema, and click Apply to create your new schema.

Other options include clicking the "Create Schema" icon on the main navigation bar, or executing a "CREATE SCHEMA your db name" guery in the SQL editor.

A.4. Is there an easy way to select all data from a table, and then see the results?

From the schema navigator, hover over the table and click the icon. This executes a "SELECT \* FROM schema.table" query and loads the results into the result grid. From there you can view or edit the data.

Alternatively, right-click on a table and select **Select Rows - Limit 1000** form the context menu.

#### **Workbench Functionality**

A.1 How do I use the SSL Certificate wizard to enable SSL for both my MySQL server and MySQL	
client?	416
A.2 How do I copy my saved MySQL connections in Workbench to a different computer?	416
A.3 How can I view my MySQL Workbench query history?	416
A.4 Can I preserve a results tab rather than have it refresh every time I execute a statement?	416
A.5 How does the embedded web browser functionality work? For example, clicking Workbench	
Forum on the Home screen opens the forum in its own embedded MySQL Workbench tab	417
A.6 How does MySQL Workbench increase import performance?	417

**A.1.** How do I use the SSL Certificate wizard to enable SSL for both my MySQL server and MySQL client?

Execute the wizard to generate the SSL certificates, and then modify your MySQL server's configuration file (my.cnf or my.ini) accordingly. You can copy-n-paste entries for the SSL options from the generated sample-my.cnf sample file. Next, confirm that the SSL CA File, CERT File, and Key File values are properly set under the SSL tab for your MySQL connection. Set Use SSL to either Require (recommended) or If available, and then execute Test Connection. This should report that SSL is enabled.

Failed SSL connections are logged in the MySQL Workbench log file. For additional information about the log file's location, see Section 3.3, "MySQL Workbench Settings and Log Files".

For additional information, see Section 5.3.4, "SSL Wizard (Certificates)".

A.2. How do I copy my saved MySQL connections in Workbench to a different computer?

From the main navigation menu, choose **Tools**, **Configuration**, and then **Backup Connections** to create a Zip file with your configured MySQL connections. Next, load this file into your new Workbench instance by using the related **Restore Connections** option.

**A.3.** How can I view my MySQL Workbench query history?

In bottom pane, change Action Output to History and then choose the appropriate date.

The SQL statement history is stored as plain text on your system under your user's MySQL Workbench configuration path in the sql\_history directory. These files are organized per date (such as 2014-01-15) and contain your MySQL Workbench SQL statement history for all MySQL connections.

**A.4.** Can I preserve a results tab rather than have it refresh every time I execute a statement?

Yes, you can pin the results tab to force it to remain and be unaffected by UPDATE and other statements. Do that by right-clicking the result tab and choose "Pin Tab" from the context-menu, or

left-click the little pin icon to toggle it. Now, execute your other queries and then refresh the pinned tab (there is a "refresh" icon in the result grid's menu).

**A.5.** How does the embedded web browser functionality work? For example, clicking **Workbench Forum** on the Home screen opens the forum in its own embedded MySQL Workbench tab.

The Webkit system library is used on OS X, Internet Explorer is used on Windows, and Linux opens the default browser externally rather than an embedded browser. Pressing **Modifier + Arrow** moves the browser history forward and back.

Additionally, for information about creating your own Home screen links, see Section 3.4, "Tutorial: Add a Custom Link to the Home Page".

**A.6.** How does MySQL Workbench increase import performance?

When a model is exported (**Database**, **Forward Engineer...**), some MySQL server variables are temporarily set to enable faster SQL import by the server. The statements added at the start of the code are:

```
SET @OLD_UNIQUE_CHECKS=@@UNIQUE_CHECKS, UNIQUE_CHECKS=0;
SET @OLD_FOREIGN_KEY_CHECKS=@@FOREIGN_KEY_CHECKS, FOREIGN_KEY_CHECKS=0;
SET @OLD_SQL_MODE=@@SQL_MODE, SQL_MODE='TRADITIONAL,ALLOW_INVALID_DATES';
```

These statements function as follows:

- SET @OLD\_UNIQUE\_CHECKS=@@UNIQUE\_CHECKS, UNIQUE\_CHECKS=0;: Determines whether InnoDB performs duplicate key checks. Import is much faster for large data sets if this check is not performed. For additional information, see unique\_checks.
- SET @OLD\_FOREIGN\_KEY\_CHECKS=@@FOREIGN\_KEY\_CHECKS, FOREIGN\_KEY\_CHECKS=0;:
   Determines whether the server should check that a referenced table exists when defining a foreign key. Due to potential circular references, this check must be turned off for the duration of the import, to permit defining foreign keys. For additional information, see foreign\_key\_checks.
- SET @OLD\_SQL\_MODE=@@SQL\_MODE, SQL\_MODE='TRADITIONAL';: Sets SQL\_MODE
  to TRADITIONAL, causing the server to operate in a more restrictive mode, and
  ALLOW\_INVALID\_DATES, causing dates to not be fully validated.

These server variables are then reset at the end of the script using the following statements:

```
SET SQL_MODE=@OLD_SQL_MODE;
SET FOREIGN_KEY_CHECKS=@OLD_FOREIGN_KEY_CHECKS;
SET UNIQUE_CHECKS=@OLD_UNIQUE_CHECKS;
```

#### Workbench Behavior

A.1 Why do my query results sometimes say <b>Read Only</b> but other times I can edit data in the results	
grid?	. 418
A.2 I'm attempting to execute a DELETE query but the query fails with an "Error Code: 1175" error.	
How do I proceed?	. 418
A.3 My MySQL server connection is timing out with an error like "Error Code: 2013. Lost connection	
to MySQL server during query". Can I adjust the timeout?	. 418
A.4 What do the column flag acronyms (PK, NN, UQ, BIN, UN, ZF, AI, G) in the MySQL Workbench	
Table Editor mean?	. 418

**A.1.** Why do my query results sometimes say **Read Only** but other times I can edit data in the results grid?

Data in the query results grid is only editable when the query results includes a primary key. For example, "SELECT type FROM food" will be read-only if "type" is not a primary key, but "SELECT id, type FROM food" will be editable when "id" is a primary key. Typically, "SELECT \*" syntax is used in Workbench which often includes query results with a primary key.

For additional information, hover over the "Read Only" icon to reveal a tooltip that explains why your result set is in read-only mode.

**A.2.** I'm attempting to execute a DELETE query but the query fails with an "Error Code: 1175" error. How do I proceed?

By default, Workbench is configured to not execute DELETE or UPDATE queries that do not include a WHERE clause on a KEY column. To alter this behavior, open your Workbench **Preferences**, select the **SQL Editor** section, and disable the following preference:

[] "Safe Updates". Forbid UPDATEs and DELETEs with no key in WHERE clause or no LIMIT clause.

Changing this preference requires you to reconnect to your MySQL server before it can take affect.

**A.3.** My MySQL server connection is timing out with an error like "Error Code: 2013. Lost connection to MySQL server during query". Can I adjust the timeout?

Yes, go to **Preferences**, **SQL Editor**, and adjust the **DBMS connection read time out** option that defaults to 600 seconds. This sets the maximum amount of time (in seconds) that a query can take before MySQL Workbench disconnects from the MySQL server.

**A.4.** What do the column flag acronyms (PK, NN, UQ, BIN, UN, ZF, AI, G) in the MySQL Workbench Table Editor mean?

Checking these boxes will alter the table column by assigning the checked constraints to the designated columns.

Hover over an acronym to view a description, and see the Section 8.1.10.2, "The Columns Tab" and MySQL CREATE TABLE documentation for additional details.

#### **Data Management**

A.1 How do I import comma-separated values (CSV) data into MySQL using Workbench?	418
A.2 How do I export MySQL data to a plain text file with a format such as CSV, JSON, or XML?	419
A.3 How to export (save) a MvSQL database to a text file?	419

A.1. How do I import comma-separated values (CSV) data into MySQL using Workbench?

Importing CSV data into a new or existing *table*: the **Table Data Import** wizard imports configurable CSV data into a new or existing table. This option was added in MySQL Workbench 6.3.

Importing CSV data into a *result set*: the **Import records from external file** wizard imports CSV data directly into a result set's view.

Alternatively, the **Data Import** wizard imports your saved MySQL files into your MySQL server. For additional information, see Section 6.5, "Data Export and Import".

If you are importing Excel files, then consider using the official MySQL for Excel Add-on for Excel.

A.2. How do I export MySQL data to a plain text file with a format such as CSV, JSON, or XML?

The results view panel in Workbench has an "Export recordset to an external file" option that exports your result set to a wide variety of formats. For additional information, see Export a Result Set.

#### **Note**

This is different than the **Data Export** wizard that exports your MySQL data to standard MySQL formats. For additional information about that, see Section 6.5, "Data Export and Import".

If you are exporting to Excel, then consider using the official MySQL for Excel Add-on for Excel.

A.3. How to export (save) a MySQL database to a text file?

Open a MySQL connection, and select **Server** from the main navigation menu and choose **Data Export** to open the data export wizard. Alternatively, choose **Data Export** from the left Management pane for the desired MySQL selection.

Here you can choose which databases to export, whether or not to include the data, dump to a single file or multiple files (one per table), and more. For additional details, see Section 6.5, "Data Export and Import".

#### General

A.1. I'm forced to use MySQL Workbench 5.2.x, is its documentation available?

Although the 5.2.x branch is no longer maintained, its documentation is archived at http://dev.mysql.com/doc/index-archive.html.

MySQL Workbench provides an extension and scripting system that enables the developer to extend MySQL Workbench capabilities. While the core of MySQL Workbench is developed using C++, it is possible to harness this core functionality using the Python scripting language. MySQL Workbench also provides access to a cross-platform GUI library, MForms, which enables the creation of extensions that feature a graphical user interface.

The extension system enables the following capabilities:

- · Automate common tasks
- Extend the Workbench user-interface
- Create Tools/Plugins (code which can be invoked from the Workbench menu system)
- Manipulate schemas
- · Create custom Workbench features

## C.1 GRT and Workbench Data Organization

The Generic RunTime (GRT) is the internal system used by MySQL Workbench to hold model document data. It is also the mechanism by which Workbench can interact with Modules and Plugins. Workbench model data, such as diagrams, schemas, and tables, is stored in a hierarchy of objects that can be accessed by any plugin. The information is represented using standard data types: integers, doubles, strings, dicts, lists, and objects.

The GRT can be accessed using the Python scripting language. Awareness is required of how the GRT data types map into Python. For example, the GRT integer, double, and string data types are seen as corresponding Python data types. Lists and dicts are kept in their internal representation, but can generally be treated as Python lists and dicts, and accessed in the usual way. Objects contain data fields and methods, but the GRT recognizes only objects from a pre-registered class hierarchy.

It is possible to fully examine the classes contained within the GRT using the Workbench Scripting Shell. Dots in class names are changed to underscores in their Python counterparts. For example, db.mysql.Table becomes db\_mysql\_Table in Python.

## **Application Objects Tree (GRT Tree)**

As mentioned previously, MySQL Workbench document data is stored in an object hierarchy. This hierarchy is known as the GRT Tree. The GRT Tree can be accessed and modified using Python or C++. Be careful when modifying the GRT Tree as mistakes can lead to document corruption. Backups should be made before manipulating the tree. Read-only access to the tree is the safest approach, and is sufficient in most cases.

### **Main Nodes in the Application Object Tree**

Table C.1 The main nodes in the Application Object Tree

Node	Description
wb.registry	Application data such as plugin registry, list of editors, and options.
wb.customData	A generic dictionary for data you can use to store your own data. This dictionary is saved and reloaded with Workbench and is global (not document specific).
wb.options	Contains some default options that are used by Workbench.
wb.rdbmsMgmt	Internal registry of supported RDBMS modules, known data types.
wb.doc	The currently loaded model document.
wb.doc.physicalModels[0]	The currently loaded model object, containing the database catalog and diagrams.
wb.doc.physicalModels[0].catalog	The database catalog for the model. Contains the list of schemas.
wb.doc.physicalModels[0]catalog.schemata	List of schemas in the model. Individual schema can be accessed as a list: schemata[0], schemata[1]
wb.doc.physicalModels[0].catalog.schemata[0].tables (.views, .routines,)	Lists of tables, views, routines in the schema.
wb.doc.physicalModels[0].diagrams	List of EER diagrams in the model.
wb.doc.physicalModels[0].diagrams[0].figures (.layers, .connections,)	List of figures, layers, connections (relationships) in the diagram.

## **C.2 Modules**

In the GRT Modules are libraries containing a list of functions that are exported for use by code in other modules, scripts, or Workbench itself. Modules can be written in C++ or Python, but the data types used for arguments and the return value must be GRT types.

GRT modules are similar to Python modules, but are imported from the built-in <code>grt</code> module, instead of directly from an external file. The list of modules loaded into the <code>grt</code> module is obtained from <code>grt.modules</code>. Modules can be imported in Python using statements such as <code>from grt.modules</code> import <code>WbModel</code>.

To export functions as a module from Python code, perform the following steps:

1. The source file must be located in the user modules folder. This path is displayed in the Workbench Scripting Shell with the label **Looking for user plugins in**. It is also possible to install the file using the main menu item **Scripting**, **Install Plugin/Module File**.

Default module file locations:

**Table C.2 Default User Module File Location** 

Operating System	File Path
Windows	%AppData%\MySQL\Workbench\modules
macOS	~username/Library/Application Support/MySQL/Workbench/modules
Linux	~username/.mysql/workbench/modules

- 2. The source file name must have the extension \_grt.py; for example, my\_module\_grt.py.
- 3. Some module metadata must be defined. This can be done using the DefineModule function from the wb module:

```
from wb import *
ModuleInfo = DefineModule(name='MyModule', author='Your Name', version='1.0')
```

4. Functions to be exported require their signature to be declared. This is achieved using the export decorator in the previously created ModuleInfo object:

```
@ModuleInfo.export(grt.INT, grt.STRING)
def checkString(s):
...
```

For the export statement, the return type is listed first, followed by the input parameter types, specified as GRT typenames. The following typenames can be used:

- grt.INT: An integer value. Also used for boolean values.
- grt.DOUBLE: A floating-point numeric value.
- grt.STRING: UTF-8 or ASCII string data.
- grt.DICT: A key/value dictionary item. Keys must be strings.
- grt.LIST: A list of other values. It is possible to specify the type of the contents as a tuple in the form (grt.LIST, <type-or-class>). For example, (grt.LIST, grt.STRING) for a list of strings. For a list of table objects, the following would be specified: (grt.LIST, grt.classes.db\_table).
- grt.OBJECT: An instance of a GRT object or a GRT class object, from grt.classes.

#### Note

These types are defined in the grt module, which must be imported before they are available for use.

The following code snippet illustrates declaring a module that exports a single function:

```
from wb import *
import grt
```

```
ModuleInfo = DefineModule(name='MyModule', author="your name", version='1.0')

@ModuleInfo.export(grt.DOUBLE, grt.STRING, (grt.LIST, grt.DOUBLE))
def printListSum(message, doubleList):
    sum = 0
    for d in doubleList:
        sum = sum + d
    print message, sum
    return sum
```

## C.3 Plugins and Tools

Plugins are special Modules that are exposed to the user through the Workbench GUI. This is typically done using the main menu, or the context-sensitive menu. Much of the MySQL Workbench functionality is implemented using plugins; for example, table, view, and routine editors are native C++ plugins, as are the forward and reverse engineering wizards. The Administrator facility in MySQL Workbench is implemented entirely as a plugin in Python.

A plugin can be a simple function that performs some action on an input, and ends without further interaction with the user. Examples of this include auto-arranging a diagram, or making batch changes to objects. To create a simple plugin, the function must be located in a module and declared as a plugin using the plugin decorator of the ModuleInfo object.

Plugins can have an indefinite runtime, such as when they are driven by the user through a graphical user interface. This is the case for the object editors and wizards within MySQL Workbench. Although the wizard type of plugin must be declared in the usual way, only the entry point of the plugin will need to be executed in the plugin function, as most of the additional functionality will be invoked as a result of the user interacting with the GUI.

#### Note

Reloading a plugin requires MySQL Workbench to be restarted.

Imported plugin files (and their compiled counterparts) are stored here:

**Table C.3 User Plugin File Location** 

Operating System	File Path
Windows	%AppData%\MySQL\Workbench\modules
macOS	~username/Library/Application Support/MySQL/Workbench/modules
Linux	~username/.mysql/workbench/modules

Declare a plugin using this syntax:

```
@ModuleInfo.plugin(plugin_name, caption, [input], [groups], [pluginMenu])
```

These parameters are defined as follows:

- plugin\_name: A unique name for the plugin. It may contain only alphanumeric characters, dots, and underscores.
- caption: A caption to use for the plugin in menus.

- input: An optional list of input arguments.
- groups: Optional list of groups the plugin belongs to. Recognized values are:
  - Overview/Utility: The Context menu in the Model Overview.
  - Model/Utility: The menu for diagram objects.
  - Menu/<category>: The **Plugins** menu in the main menu.
- pluginMenu: Optional name of a submenu in the Plugins menu where the plugin should appear. For example, Catalog, Objects, Utilities. This is equivalent to adding a Menu/<category> in the groups list

## C.4 Adding a GUI to a Plugin Using MForms

MySQL Workbench is implemented with a C++ core back-end, and a native front-end for each supported platform. Currently the front-end is implemented with Windows Forms on Microsoft Windows, GTK+ on Linux, and Cocoa on OS X / macOS. This approach permits the application to have a native look and feel, while reducing the amount of work required to maintain the project. However, the GUI functionality required by MySQL Workbench can be met by a subset of graphical operations. These are implemented in a cross-platform GUI library, MForms. This further reduces the development effort because plugin developers can use MForms rather than writing front-end specific code for each supported platform. This also helps consistency of operation across all platforms. MForms is coded in C++, but provides a Python interface. To use it, the Python code must import the mforms module.

#### MForms Containers

Given the problems of using an absolute coordinate system across different platforms, MForms employs containers that perform automatic layout. The basic containers that MForms provides include:

- **Form**: A top-level window which can contain a single control, usually another container. The window will be sized automatically to fit its contents, but can also be sized statically.
- Box: This container can be filled with one or more controls in a vertical or horizontal layout. Each
  child control can be set to use either the minimum of required space, or fill the box in the direction of
  the layout. In the direction perpendicular to the layout, for example vertical in a horizontal layout, the
  smallest possible size that can accommodate all child controls will be employed. So, in this example, the
  smallest height possible to accommodate the controls would be used.
- **Table**: This container can organize one or more controls in a grid. The number of rows and columns in the table, and the location of controls within the grid, can be set by the developer.
- **ScrollView**: This container can contain a single child control, and adds scrollbars if the contents do not fit the available space.

## C.5 The Workbench Scripting Shell

The Workbench Scripting Shell provides a means for entering and executing Python scripts. Through the use of the scripting shell, MySQL Workbench can support new behavior and data sources using code written in Python. The shell can also be used to explore the current Workbench Generic RunTime (GRT) facilities.

The scripting shell is not only useful for expanding MySQL Workbench. You can use a script file from the scripting shell command line to perform repetitive tasks programmatically.

#### Note

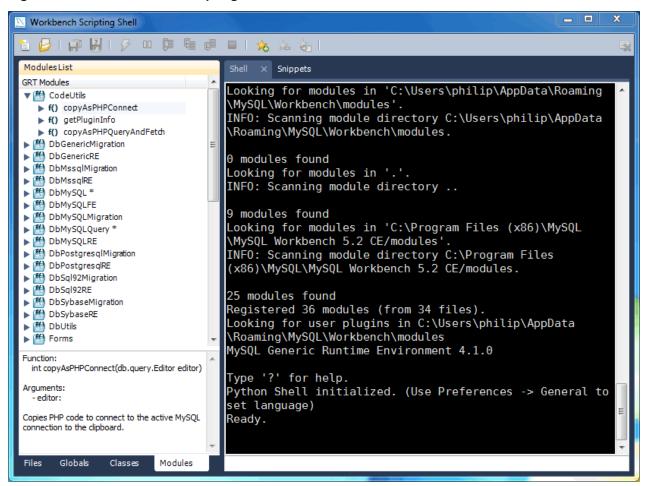

MySQL also has a product named MySQL Utilities, which is different than Workbench Scripting Shell.

### C.5.1 Exploring the Workbench Scripting Shell

To open the Workbench Scripting Shell, select **Scripting**, **Scripting Shell** from the main menu. You can also open the Workbench Scripting Shell using the **Control** + **F3** key combination on Windows and Linux, **Command** + **F3** on macOS, or by clicking the shell button above the EER diagram navigator. The Workbench Scripting Shell will then open in a new dialog.

The following figure shows the Workbench Scripting Shell dialog.

Figure C.1 The Workbench Scripting Shell

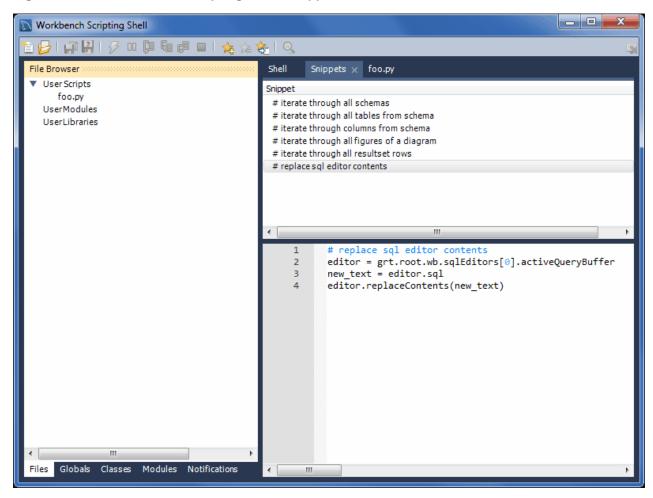

### C.5.2 The Shell Window

The Workbench Scripting Shell is primarily used for running Python scripts, or directly typing commands in Python. However, you can also use it to access the Workbench Scripting Shell Scripting Library functions and global functions and objects. To see the available commands, type "?". You can also cut and paste text to and from the shell window.

The **Snippets** tab is a scratch pad for saving code snippets, which makes it easy to reuse and execute code in MySQL Workbench. The following figure shows the Snippets tab selected.

Figure C.2 The Workbench Scripting Shell: Snippets

Opened script file tabs are to the right of the **Snippets** tab. Script tabs are labeled with the script's filename, or <u>Unnamed</u> for snippets without a name. You can cut-and-paste to and from the tabs, or right-click on a snippet to open a context menu with options to **Execute Snippet**, **Send to Script Editor**, or **Copy To Clipboard**.

While individual commands can be entered into the shell, it is also possible to run a longer script, stored in an external file, using the main menu item **Scripting**, **Run Workbench Script File**. When scripts are run outside of the shell, to see the output use the main menu item **View**, **Output**.

It is also possible to run script files directly from the shell. For details on running script files, type ? run at the Workbench Scripting Shell prompt. The following message is displayed:

```

Within the Workbench Scripting Shell, there are five tabs on the top of the left side panel: **Files**, **Globals**, **Classes**, and **Modules**, and **Notifications**.

#### Note

An exception is thrown while attempting to use input() or read from stdin.

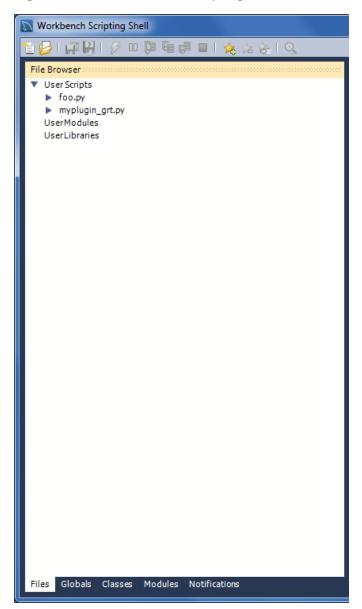

### C.5.3 Files, Globals, Classes, Modules, and Notifications Tabs

The Workbench Scripting Shell features the Files, Globals, Classes, Modules, and Notifications tabs, in addition to the main Shell tab.

#### Files Tab

The **Files** tab lists folders and files for user-defined (custom) script files. The file-browser categories are **User Scripts**, **User Modules**, and **User Libraries**, as the following figure shows.

Figure C.3 The Workbench Scripting Shell tab: Files

By default, scripts are stored in the scripts/ folder of your MySQL Workbench configuration folder. The following table lists the default location for each platform.

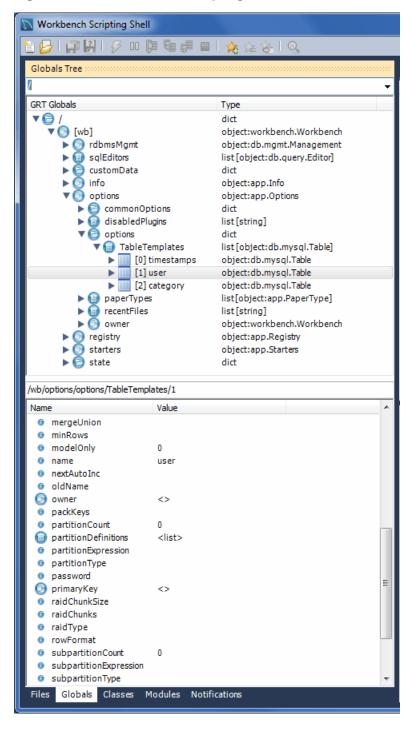

**Table C.4 Default Scripts Location** 

Operating System	Default scripts/ path	
Linux	~/.mysql/workbench/scripts	
macOS	~/Library/Application\ Support/MySQL/Workbench/ scripts/	
Windows 7	<pre>C:\Users\[user]\AppData\Roaming\MySQL\Workbench \scripts\</pre>	

### **Globals Tab**

At the top of the window is a list that is used to select the starting point, or root, of the GRT Globals tree displayed beneath it (see the following figure). By default, this starting point is the root of the tree, that is, '/'. You can expand or collapse the GRT Globals tree as desired. The GRT Globals tree is the structure in which MySQL Workbench stores document data. Clicking any item results in its name and value being displayed in the panel below the tree.

### **Classes Tab**

A class is a user-defined data type formed by combining primitive data types: integers, doubles, strings, dicts, lists, and objects. This tab shows the definitions of the classes used by the objects in the **Modules** tab. Clicking a class causes a brief description of the class to be displayed in a panel below the classes explorer, as shown in the next figure.

Figure C.5 The Workbench Scripting Shell Tab: Classes

When the **Classes** tab is selected, the list displays the following items:

- Group by Name: Group by the object name
- · Group by Hierarchy: Group by inheritance
- Group by Package: Group by functionality

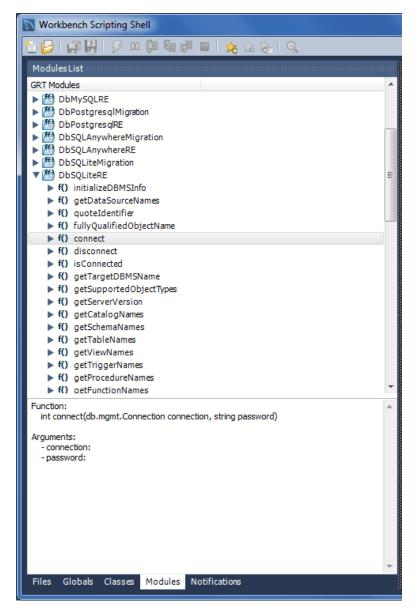

The default view for this tab is **Group By Name**. This view shows all the different objects arranged alphabetically. Click the **+** icon or double-click a package to show the properties of the struct.

If you switch to the hierarchical view, you will see GrtObject: the parent object from which all other objects are derived.

#### **Modules Tab**

The **Modules** tab enables you to browse the MySQL Workbench installed modules and their functions. Clicking a module within the explorer causes its details to be displayed in a panel below the explorer, as the following figure shows. This facility is useful for exploring the available modules, and their supported functions. It is also a way to check whether custom modules have been correctly installed.

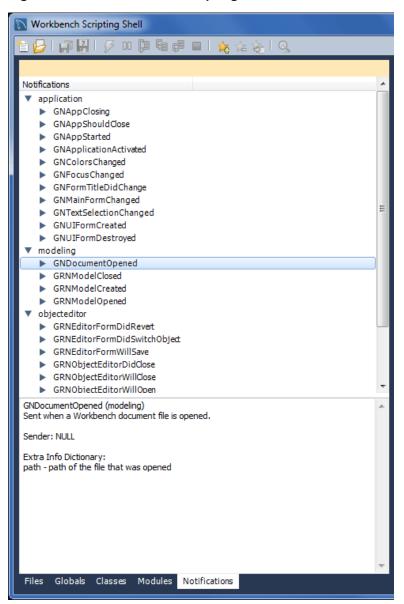

Figure C.6 The Workbench Scripting Shell Tab: Modules

### **Notifications Tab**

The **Notification** tab includes the set of notification classes used by MySQL Workbench modules. Click a notification class for a description of its use, as demonstrated in the next figure.

# **C.6 Tutorial: Writing Plugins**

The tutorials in this section demonstrate how to extend MySQL Workbench by creating custom plugins.

## C.6.1 Tutorial: Generate PHP Code to Create a Connection with PDO\_MySQL

MySQL Workbench includes a plugin that generates PHP code with the mysqli extension. This tutorial shows how to generate code with the PDO\_MySQL extension for PHP. You might choose a different extension or a different language altogether, so adjust the generated code accordingly.

To begin, review the plugin code shown in the example that follows.

```
# import the wb module
from wb import DefineModule, wbinputs
# import the grt module
import grt
# import the mforms module for GUI stuff
import mforms
# define this Python module as a GRT module
ModuleInfo = DefineModule(name= "MySQLPDO", author= "Yours Truly", version="1.0")
@ModuleInfo.plugin("info.yourstruly.wb.mysqlpdo", caption= "MySQL PDO (Connect to Server)", input= [wbinputs.c
@ModuleInfo.export(grt.INT, grt.classes.db_query_Editor)
def mysqlpdo(editor):
    """Copies PHP code to connect to the active MySQL connection using PDO, to the clipboard.
    # Values depend on the active connection type
    if editor.connection:
        conn = editor.connection
        if conn.driver.name == "MysqlNativeSocket":
            params = {
            "host" : "",
            "port" : "",
            "user" : conn.parameterValues["userName"],
            "socket" : conn.parameterValues["socket"],
            "dbname" : editor.defaultSchema,
            "dsn" : "mysql:unix_socket={$socket};dbname={$dbname}"
        else:
            params = {
            "host" : conn.parameterValues["hostName"],
            "port" : conn.parameterValues["port"] if conn.parameterValues["port"] else 3306,
            "user" : conn.parameterValues["userName"],
            "socket" : "",
            "dbname" : editor.defaultSchema,
            "dsn" : "mysql:host={$host};port={$port};dbname={$dbname}"
        text = """$host="%(host)s";
$port=%(port)s;
$socket="%(socket)s";
$user="%(user)s";
$password="";
$dbname="%(dbname)s";
   $dbh = new PDO("%(dsn)s", $user, $password));
} catch (PDOException $e) {
    echo 'Connection failed: ' . $e->getMessage();
""" % params
       mforms.Utilities.set_clipboard_text(text)
        mforms.App.get().set_status_text("Copied PHP code to clipboard")
   return 0
```

This simple plugin generates PHP code to create a MySQL connection using PHP's PDO\_MySQL extension. The DSN definition depends on the connection type in MySQL Workbench. The part you might want to modify is within the text definition.

To generate PHP code for a connection, first install the plugin as follows:

- 1. Copy the plugin code into a new file. The file name used in this example is php-pdo-connect grt.py, but you can use a different name as long as grt.py is the suffix.
- 2. Start MySQL Workbench. Click **Scripting** and then **Install Plugin/Module** from the menu to open a file browser. Select the plugin file created by the code in the previous step, php-pdo-connect\_grt.py in this case.

#### Note

You could copy the file directly to the plugin folder instead of using the **Install Plugin/Module** interface. The result would be the same.

- 3. When prompted, restart MySQL Workbench. This step generates a compiled bytecode file (.pyc) from your source file. In this example, it generates php-pdo-connect\_grt.pyc.
- 4. After restarting MySQL Workbench, load the MySQL connection to use to generate the PHP code. From the menu, click Tools, Utilities, and then MySQL PDO (Connect to Server), which is the Caption defined within the plugin code.

This action copies the generated PHP code into the clipboard on your system. The following connection example defines "sakila" as the default database in the generated code.

## C.6.2 Tutorial: Generating Foreign Keys with MylSAM

EER Diagrams are useful for visualizing complex database schemata. They are often created for existing databases, to clarify their purpose or document them. MySQL Workbench provides facilities for reverse engineering existing databases, and then creating an EER Diagram automatically. In this case, relationship lines between foreign keys in the table will automatically be drawn. This graphical representation makes the relationships between the tables much easier to understand. However, the older MyISAM storage engine does not include support for foreign keys. This means that MyISAM tables that are reverse engineered will not automatically have the relationship lines drawn between tables, making the database harder to understand. The plugin created in this tutorial gets around this problem by using the fact that a naming convention is often used for foreign keys: tablename\_primarykeyname. Using this convention, foreign keys can automatically be created after a database is reverse engineered, which will result in relationship lines being drawn in the EER diagram.

### **Algorithm**

The basic algorithm for this task would be as follows:

```
for each table in the schema
for each column in the table
look for another table whose name and primary key name match the current column name
```

```
if such a table is found, add a foreign key referencing it
```

As iterating the complete table list to find a match can be slow for models with a large number of tables, it is necessary to optimize by pre-computing all possible foreign key names in a given schema.

```
import grt
def auto_create_fks(schema):
   fk_name_format = "%(table)s_%(pk)s"
   possible_fks = {}
   # create the list of possible foreign keys from the list of tables
   for table in schema.tables:
      if table.primaryKey:
         format_args = { 'table':table.name, 'pk':table.primaryKey.name}
         fkname = fk_name_format % format_args
         possible_fks[fkname] = table
   # go through all tables in schema, this time to find columns that may be a fk
   for table in schema.tables:
      for column in table.columns:
         if possible_fks.has_key(column.name):
            ref_table = possible_fks[column.name]
            if ref_table.primaryKey.formattedType != column.type:
               continue
            fk = table.createForeignKey(column.name+"_fk")
            fk.referencedTable = ref_table
            fk.columns.append(column)
            fk.referencedColumn.append(ref_table.primaryKey)
            print "Created foreign key %s from %s.%s to %s.%s" \
            % (fk.name, table.name, column.name, ref_table.name, ref_table.primaryKey.name)
auto_create_fks(grt.root.wb.doc.physicalModels[0].catalog.schemata[0])
```

#### Creating a Plugin from a Script

To create a plugin from an arbitrary script, it is first necessary to make the file a module, and export the required function from it. It is then necessary to declare the module as a plugin, and specify the return type and input arguments.

```
from wb import *
import grt

ModuleInfo = DefineModule(name="AutoFK", author="John Doe", version="1.0")

@ModuleInfo.plugin("sample.createGuessedForeignKeys",
    caption="Create Foreign Keys from ColumnNames",
    input=[wbinputs.objectOfClass("db.mysql.schema")],
    groups=["Overview/Utility"])

@ModuleInfo.export(grt.INT, grt.classes.db_mysql_Schema)
def auto_create_fks(schema):
    ...
```

With the addition of the preceding code, the <a href="mailto:auto\_create\_fks">auto\_create\_fks</a>() function is exported and will be added to the schema context menu in the model overview. When invoked, it receives the currently selected schema as its input.

# Appendix D How To Report Bugs or Problems

The following is a list of tips and information that is helpful for reporting a MySQL Workbench bug.

### A useful bug report includes:

- · The exact steps taken to repeat the bug, ideally as a video if the bug is tricky to repeat
- · A screenshot, if the bug is visual
- The error messages, which includes text sent to stdout and the GUI
- The MySQL Workbench Log file

The log file location can be found using **Help**, **Locate Log Files** from within MySQL Workbench.

Bugs that cannot be reproduced are difficult and nearly impossible to fix, so it is important to provide the steps necessary to reproduce the bug.

### Where to report a bug

Visit http://bugs.mysql.com/ and use one of the "MySQL Workbench" bug categories.

### Log Levels

There are six different log levels, with increasing levels of verbosity: error, warning, info, debug1, debug2, and debug3. By default, the error, warning and info levels are enabled. There is also a "none" level that disables logging.

#### **Important**

Please enable the debug3 level before generating a log for the report.

The enabled error log levels can be configured using an environment variable, or by using a command line parameter.

Both the environment variable and command line variants accept a single error level, but enabling a more verbose option will implicitly enable the levels below it. For example, passing in "info" will also enable the "error" and "warning" levels.

• Environment variable: WB\_LOG\_LEVEL

Command line option: --log-level on macOS and Linux, and -log-level on Microsoft Windows

#### Note

If both the command line and environment variable are set, the command line takes precedence.

#### For example:

```
# Microsoft Windows
shell> cd "C:\Program Files (x86)\MySQL\MySQL Workbench CE 6.3.10\"
shell> MySQLWorkbench.exe -log-level=debug3
```

```
# macOS
shell> cd /Applications
shell> MySQLWorkbench --log-level=debug3
# Linux (Ubuntu)
shell> cd /usr/bin
shell> mysqlworkbench --log-level=debug3
```

If the info level is enabled, the system information and all paths used in the application are also logged. On Microsoft Windows, this also means that the log file contains the full set of current environment variables that are active for the program.

### **Operating System Specific Notes**

#### **Microsoft Windows**

- Log file location: Near the user's app data folder, such as C:\Users\[user]\AppData\Roaming \MySQL\Workbench\log for Microsoft Windows 7.
- In case of errors (or exceptions), the log file contains the stack trace to the point MySQL Workbench can track it (usually only C# code, and not C++ code). Also, all warnings are added to the log if the warning (or greater) log level is enabled.
- If it is a crash and that cannot be replicated by the MySQL Workbench team, and the stack trace cannot be obtained, we will request a crashdump. Instructions for enabling a crashdump can be found here, and please also read the MSDN details for this as we need a full dump, and not the mini dump.
- For crashes related to display issues, start MySQL Workbench with the -swrendering parameter (and only then, as it switches off OpenGL rendering, which is of no use in WBA or WQE). This output will be added to the log file.
- If it is a crash when MySQL Workbench is started (especially if the error report includes something about kernelbase.dll), we will ask you to run depends.exe on the MySQLWorkbench.exe binary, and ask for the reported errors.
- If it is a crash when MySQL Workbench is started, and it is a 64-bit version of Microsoft Windows, check that the correct MSVC runtimes are installed. Often people install the 64-bit version of them, but only the 32-bit will function. More precisely: MSVC 2010 runtime x86 (32-bit).

### macOS

- Log File Location: ~/Library/Application Support/MySQL/Workbench/logs
- System crash logs generated for Workbench are in ~/Library/Logs/DiagnosticReports/ MySQLWorkbench\*

#### Linux

- Log File Location: ~/.mysql/workbench/logs
- For a crash, we might ask for a stack trace that can generated by gdb by using the following steps:

#### Note

Because published MySQL Workbench builds lack debug symbols, this step is optional and will probably not be necessary.

- In shell, execute source /usr/bin/mysql-workbench
- Quit MySQL Workbench
- In shell, execute gdb /usr/bin/mysql-workbench-bin
- In the gdb interface, type run
- In MySQL Workbench, repeat the crash
- In the gdb interface, type bt
- If it is a crash, also run glxinfo. If that also crashes, then it is a driver/X server problem related to OpenGL that is not specific to MySQL Workbench.

# Appendix E MySQL Enterprise Features

A MySQL Enterprise subscription is the most comprehensive offering of MySQL database software, services and support; it ensures that your business achieves the highest levels of reliability, security, and uptime.

An Enterprise Subscription includes a MySQL Workbench GUI for the following enterprise features:

- The MySQL Enterprise server: The most reliable, secure, and up-to-date version of the world's most popular open source database
- MySQL Enterprise Backup: Performs backup and restore operations for MySQL data, and MySQL Workbench offers a GUI for these operations
- MySQL Enterprise Audit: An easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines
- MySQL Enterprise Firewall: regulatory guidelines
- DBDoc Model Reporting Templates: For accessing the Ctemplate System.
- Model Validation: Validation modules for testing models before implementing them, both with general RDMS and specific MySQL rules.
- MySQL Production Support (MOS): Technical and consultative support when you need it, along
  with regularly scheduled service packs, and hot-fixes, and MySQL Workbench links to your My Oracle
  Support (MOS) service

For more information, visit http://www.mysql.com/enterprise

# Appendix F MySQL Utilities

MySQL Utilities is a package of utilities that are used for maintenance and administration of MySQL servers. These utilities encapsulate a set of primitive commands, and bundles them so they can be used to perform macro operations with a single command. They can be installed with MySQL Workbench or as a standalone package.

They are a set of command-line utilities and a Python library for making the common tasks easy to accomplish. The library is written entirely in Python, meaning that it is not necessary to have any other tools or libraries installed to make it work. It is currently designed to work with Python v2.6 or later and there is no support (yet) for Python v3.1.

The utilities are available under the GPLv2 license, and are extendable using the supplied library.

For more information, see the MySQL Utilities manual at MySQL Utilities.

### **Installing The MySQL Utilities**

MySQL Utilities development is managed elsewhere, and require a separate download. Attempting to start the MySQL Utilities when they are not installed will prompt for a download and their installation. See the MySQL Utilities manual for additional information.

#### **Note**

MySQL Workbench searches for the mysqluc MySQL Utility in the system PATH to determine if the MySQL Utilities are installed.

## **Opening MySQL Utilities From MySQL Workbench**

To open the MySQL Utility mysqluc (MySQL Utilities Unified Console) from MySQL Workbench, select **Start Shell for MySQL Utilities** from the **Tools** menu. The following figure shows the MySQL Utilities console window with the help command executed.
